

Software And Tools To Enrich Your DIGITAL ELECTRONIC UTILITIES

SHANOSH KUMAR

Description UMHDL setup-2.0 IDE for learning HDLs

UMHDL is an educational integrated development environment (IDE) intended for learning digital designing with programmable logic devices. By using hardware description languages (HDLs) through simulation, this open source tool allows learning VHDL language. Its front-end has an interface that allows writing code (with syntax highlighting), invokes an external VHDL compiler and simulator (such as GHDL) and displays the result of the simulation graphically as waveforms (invoking to GTKWave).

KJWaves, SPICE3 GUI and waveform viewer

KJWaves allows for easy modification and viewing of SPICE circuit files. It also reads SPICE3 RAW format (as well as GnuCap) and creates graphs of results through an interactive graphical user interface (GUI). It supports waveform maths and copying to clipboard, too.

Weka

Weka is a collection of machine-learning algorithms for solving real-world data-mining problems. It is written in Java and runs on almost any platform. Algorithms can be called using Java codes or can be applied directly to a dataset.

openSCADA

openSCADA is the companion project to Eclipse SCADA. It is platform-independent and based on a modern system design that provides security and flexibility. It provides develop-

Some popular resources

Finite Element Method Magnetics. This application is a Windows finite element solver for 2D and asymmetric magnetic, electrostatic, heat-flow and current-flow problems with graphical pre- and post-processors.

DispcalGUI. DispcalGUI is a GUI for display calibration and profiling tools of Argyll CMS, an open source colour-management system. This software allows the user to calibrate and characterise display devices using one of the many supported measurement instruments along with support for multi-display setups and a variety of available settings like customisable white point, luminance and tone-response curve. There is also an option to create accurate look-up-table ICC profiles including some proprietary 3D LUT formats. The platform also allows checking the accuracy of profiles and 3D LUTs via measurements.

Apache OpenOffice. It is an open source office productivity software suite. It contains a word processor (Writer), spreadsheet (Calc), presentation application (Impress), drawing application (Draw), formula editor (Math) and database-management application (Base).

Version 4.1.2 contains major bug fixes as follows:

- Bug fixes in Writer, Calc, Impress/Draw and Base
- Better WebDAV and file-locking support; OpenOffice now able to properly interact with Microsoft Sharepoint
- Redesign of PDF export dialogue for better usability on small laptop screens
- Updates of underlying libraries has increased security and performance
- Security vulnerability fixes applied in this version

ment libraries, interface applications, mass configuration tools, front-end and back-end applications.

TANGO

TANGO is an open source toolkit for building high-performance and high-quality distributed control systems for small and large installations. The toolkit design is based on the concept of distributed devices or objects and provides native support for multiple programming languages. It implements a full set of tools for developing, managing and monitoring small and large control systems.

LibreCAD

LibreCAD is a free open source computer-aided design (CAD) application for Windows, Apple and

Linux. Support and documentation is free from its large, dedicated community of users, contributors and developers.

Tizen SDK

Tizen SDK is a comprehensive set of tools for developing Tizen Web and native applications. It consists of an IDE, emulator, toolchain, sample code and documentation. Tizen SDK runs on Windows and this edition of DVD has 64-bit and 32-bit versions of the software. Tizen applications can be developed without relying on official Tizen IDE, as long as the application complies with Tizen packaging rules. **EFY**
