Keeping An Eye On INDIA'S SURVEILLANCE INDUSTRY

Sudeshna Das is senior executive editor at EFY

In addition to usual factors like general economic growth, increased awareness, legal requirements and affordability that drive growth in the security and surveillance industry, the increasing number of terrorist attacks and criminal activities make surveillance systems almost imperative for residential, commercial and public infrastructure and also for public transport in India.

"There is a spurt in infrastructure development in the country. Security is a part of the basic infrastructure for any modern economy. Naturally, we see significant growth potential for security solutions in India," says Ganesh Jivani, managing director, Matrix Comsec.

Advantages of surveillance systems over physical security such as the ability to allow remote monitoring and continuous monitoring have resulted in their wide deployment across the country. According to a report published by 6Wresearch India, a business research organisation, video surveillance market in India is expected to reach US\$ 952.94 million by 2016, with a CAGR of 32.49 per cent. It is expected to top US\$ 2.4 billion by 2021.

Currently, though analogue based surveillance systems account for the majority of the share of nearly 68 per cent in the overall market, IP based surveillance systems are expected to grow with a relatively higher CAGR of 41.78 per cent in the coming years.

As per a spokesperson from 6Wresearch, electronics division, "Declining prices, terrorist strikes, government initiatives, rising public infrastructure, increasing government security spending and growing awareness have fuelled the adoption of IP surveillance systems in India. Further, the surging need for video analytics and remote monitoring have also led to rising penetration of IP surveillance systems in the country."

Market drivers

"The commercial sector is estimated to have been the largest end-user sector that includes hotels, restaurants and offices. It is followed by banking and finance, retail, manufacturing and industrial and government sectors. The fast-growing end-user

Video analytics intelligently detect suspicious movements using CCTV surveillance
