

SINC M[®]

Electronics Educational Trainer Kits

MORE THAN

1200

TRAINER KITS

AT YOUR SERVICE

Laboratories covered

- Basic & Applied Electronics
- Analog Communications
- Digital Communications
- TV Trainers (Colour/ B&W)
- Consumer Electronics Lab
- Fiber Optics Communications
- Digital Electronics
- Power/Industrial Electronics
- Linear Integrated Circuits
- Network Analysis, Bridges, Theorems
- Electronics Components Display Boards
- Advance Trainers
- Bread Board Trainer
- Power Supplies (Single, Dual, Multioutput)

An ISO 9001:2008
Certified Company

Manufactured by

SINDHU ELECTRONICS AND COMMUNICATIONS PVT. LTD.

Office : 8, Shantiniketan colony, Pratap Nagar, Nagpur-440 022 (MS)
Ph : 91-712-2287174, 2293303, Telefax : 91-712-2287174
E-mail : sincm22@hotmail.com, info@sincmindia.com
Website : www.sincmindia.com

Point of view: Why e-training ecosystem is important

Technology is advancing at lightning speed. First, it was the rise of robotics, then mechatronics and now the Internet of Things (IoT). This diverse growth and amalgamation of technologies has left the engineers in a very difficult scenario; upgradation of skill set is required at a similar pace, which is not possible with the curriculum academia provides or the bird's-eye view of the overall technology provided by academic organisations.

As far as India is concerned, the outcome of being a software-servicing Mecca of the world is that, majority of engineers hardly get the right exposure to underlying system designs, which prohibits India from further developing skilled manpower. Solving this problem requires particular hands-on skills catered by vocational training institutes with their brick and mortar system, who are already witnessing their own set of limitations. With the ever-expanding Internet, people want to upgrade themselves on-the-go, and this need is driving the e-learning ecosystem.

(A Phi Robotics Research Enterprise)

input/output (I/O) layout designs.” He adds, “We are also seeing a lot of traction for application-specific integrated circuit (ASIC) physical design implementation at block level.”

Observing a rising demand for verification training, Deepa J., manager - training, Sandeepani School of VLSI and Embedded Systems Design, says, “New verification methodologies have been introduced lately, which are slowly being adopted by companies. Earlier, we were much more into training for IP verification. Now, there is a lot more activity in the systems on chip (SoC) verification space and we will be introducing a course on SoC verification in the near future.”

She adds, “Field programmable gate array (FPGA) applications are more prevalent now. Many embedded applications use FPGAs. So, there is a lot of demand for FPGA based training too.”

N. Arulselvan, director, Nettur Technical Training Foundation, is seeing an increasing demand in the embedded system design. He says, “There is an increased demand from companies looking for electronics graduates with software skills in embedded system design.”

He adds, “We have introduced mechatronics in a big way. It is becoming a popular choice among people coming for training as compared to a course in electronics.” It is a multi-disciplinary program with electronics and mechanical aspects

Notable players dealing in training products

- Anshuman Tech Pvt Ltd
- Dynalog (India) Ltd
- Edkits Electronics
- Kits'n'Spares
- Lab Electronics
- Phi Education Solutions Pvt Ltd
- Rhydo Technologies Pvt Ltd
- Romtek India
- Scientech Technologies Pvt Ltd
- Vi Microsystems Pvt Ltd

mixed in the right proportion. “This course is very useful for professionals from sectors into machine tool building such as CNC machines, automobile as well as electronic products,” he adds.

Tevatron Technologies too has increased focus on providing training on mechatronics. Kaintura informs, “The course on mechatronics focuses on CAD designing, electronic control and PCB designing.” He adds, “We provide mentorship to students working on projects not only through our internal staff but also from highly-skilled engineers working in our partner organisation. We are training students on STM32 ARM processors and helping them build projects around these.”

There is a rise in professionals working in non-core areas such as the IT industry, looking to switch over to the core sector. To address this demand, Prasad says, “We have
