CAELinux: A Distribution of Open Source Engineering Tools

SNEHA AMBASTHA

Engineers are often forced to work on commercial operating systems (OSes) because of their security and versatility, but we have other platforms like Fedora Electronic Laboratory (FEL) and computer-aided engineering Linux (CAELinux). This article aims to understand CAELinux and identify its use in engineering applications.

CAELinux is basically a distribution platform with a complete set of engineering tools that are available freely for Linux users. Built on an updated Xubuntu 12.04 long-term support (LTS) 64-bit base, it focuses on upgrading all its software, developing additional wizards and expanding distribution capabilities. The latest

CAELinux on VirtualBox

System requirements

- X86_64 compatible CPU (most Intel CoreDuo (not Core2Duo), Atom and Pentium 4 are not 64-bit compatible)
- More than 2GB RAM per application

For professional use:

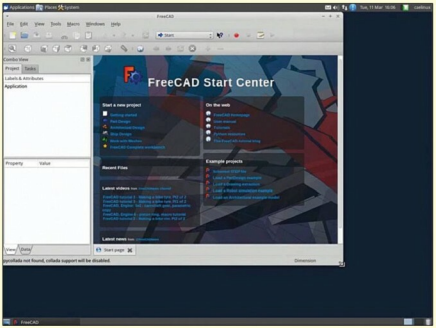

- At least 4GB of RAM (more is better) is highly recommended for everyday work

For hard disk installation:

- At least a 20GB ext3/4 partition
- 4GB swap partition

Overview

- **Version:** 2013 (latest)
- **Licence:** Open source
- **Operating system:** Ubuntu
- **Key features:**
 - Simulate complex physics with finite element analysis (FEA) and computational fluid dynamics (CFD) solvers.
 - Design parametric computer aided design (CAD) geometry, generate a computational mesh and set up simulation issues in a few minutes.

FreeCAD
