

INVESTING IN PV SOLAR? GUARD YOUR MONEY!

Currently used PV Solar Arrays with Series Strings Architecture are Energy Inefficient with many Serious Shortcomings

World's Latest Parallel Array Architecture using LEECH PV MODULES with embedded Intelligent MPPT Controller and DC Booster avoids all of these leading to 10% to 25% hike in your Energy Yield. See what you are currently losing and Why?!

- **Avoid up to 70% Catastrophic Shading Energy Loss by using LEECH PV Modules from Mitramax Energy.**
 - *If even one full cell in series string is shaded, it will likely cause the module to reduce its power level by 40 to 70% of its full available value. If a row of cells at the bottom of a module is fully shaded the power output may drop to zero.*
- **Mismatch between modules can reduce output by 15% with LEECH Modules with Panel Embedded MPPT.**
 - All modules in a conventional array have to be matched to ensure that Maximum Peak Power Tracking of the array is effective. Panels can never be perfectly matched and this prevents many panels not operating at their peak power point.
- **Uneven Heating of Modules adds to the loss by 1 to 2%.**
 - Variably heated conventional PV Panels transfers surplus photon energy is transformed into heat rather than into electrical energy. Avoid this with LEECH Modules. Vp temperature dependent and conventional Array can't track individual MPPTs...LEECH modules does.
- **Complex cabling matrix with junction boxes and high currents cause 1 - 2% Conduction Losses:**
 - High current from PV Module causes conduction loss. LEECH Modules output current is very low and avoids these losses.

While a lot of factors are beyond control, the new power optimization technology from MITRAMAX™ to harvest more power from your PV system need your serious attention. Elimination of all the above by LEECH Parallel Array from MITRAMAX will additionally benefit you in getting better returns on your long term investment in PV Power Plants.
