

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM and LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED Intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

Smartphone that can bend for controlling apps

Researchers at Queen's University's Human Media Lab have developed the world's first full-colour, high-resolution, wireless flexible smartphone that combines multi-touch with bend input. They have named the phone ReFlex, and it allows users to experience physical tactile feedback when interacting with their apps through bend gestures.

ReFlex in action (Image courtesy: www.phys.org)

According to Roel Vertegaal (School of Computing), director of Human Media Lab, when this smartphone is bent down on the right, pages flip through the fingers from right to left, just like these would in a book. More extreme bends speed up the page flips. Users can feel the sensation of the page moving through their fingertips as the phone vibrates. This allows eyes-free navigation, making it easier for them to keep track of where they are in a document.

Vertegaal gave another example where when users play Angry Birds game with ReFlex, they bend the screen to stretch the sling shot. As the rubber band expands, they experience vibrations that simulate those of a real stretching rubber band.

RFID chip that cannot be hacked

A research team at Massachusetts Institute of Technology (MIT) has developed an RFID chip that it claims is virtually impossible to hack. To combat the issue of security, researchers came up with a two-point solution; an on-chip power supply whose connection to the chip circuitry would be nearly impossible to cut and a set of non-volatile memory cells that can store whatever data the chip is working on in case a power failure begins to take place.

To make this high-end chip, exclusive ferroelectric crystals were used. As a crystal, ferroelectric material contains a 3D lattice of molecules, where equal and opposite charges produce electrical polarisation due to a separation between these, replicating the dynamics
