

Equip Yourself With THE LATEST In DESIGN And DEVELOPMENT SOFTWARE

SHANOSH KUMAR

EEGLAB

EEGLAB is an interactive MATLAB toolbox for processing continuous and event-related EEG, MEG and other electrophysiological data incorporating independent component analysis, time/frequency analysis, artefact rejection, event-related statistics and several useful modes of visualisation of the averaged and single-trial data.

Raspbian

Raspbian is a free operating system based on Debian optimised for Raspberry Pi hardware. It has basic programs and utilities, and comes with over 35,000 packages and pre-compiled software bundled in a format for easy installation on the Pi.

Arduino IDE 1.7.5

Arduino project provides an integrated development environment based on Processing project, which includes support for C and C++ programming languages for programming microcontrollers (MCUs).

Arduino is an open source computer hardware and software company, project and user community that designs and manufactures MCU based kits for building digital devices and interactive objects that can sense and control objects in the real world. The project is based on MCU board designs, manufactured by several vendors, using various MCUs. These systems provide sets of digital and analogue I/O pins that can be interfaced to various

Some popular resources

Wireshark. Wireshark is a free and open source packet analyser. It is used for network troubleshooting, analysis, software and communications protocol development, and education. Wireshark lets users put network interface controllers that support promiscuous mode into that mode, so they can see all traffic visible on that interface, and not just traffic addressed to one of the interface's configured addresses and broadcast/multicast traffic.

Specy. This tool provides detailed information about the hardware components and the operating system of a computer. The information becomes handy when you want to upgrade existing hardware, find out which specific hardware is installed on the computer, if the current hardware matches the system requirements for the software you are installing and so on. Specy analyses the computer and displays a report of the make and model of all installed hardware found on it. This includes:

1. Motherboard
2. Central processing unit
3. Random access memory (RAM); including which RAM slots on your motherboard are being used
4. Optical drives
5. Graphics cards
6. Hard drives
7. Audio
8. Peripherals
9. Network

Specy accesses hardware sensors on various components and reports their current temperature. It also allows you to save a report of your computer's hardware if you wish to share it with another person or support forum for troubleshooting purposes.

expansion boards (shields) and other circuits. The boards feature serial communication interfaces, including USB on some models, for loading programs from personal computers.

openSCADA

openSCADA is the companion project to Eclipse SCADA. It is platform-independent and based on a modern system design that provides security and flexibility. It provides development libraries, interface applications, mass configuration tools, front-end and back-end applications.

pvbrowser

pvbrowser is an application framework that provides a specialised browser for the client computer and an integrated development environment for creating servers that implement visualisation. It also provides data-acquisition programs (daemons) for many protocols that connect the real world with the server. It runs on Linux/Unix/Windows/OS-X. pvbrowser clients are also available for Maemo, MeeGo and Android. **EFY**
