As electronic gadgets increase in complexity and feature advanced wireless capabilities, testing has become imperative.

Global Industry Analysts Inc. (GIA) forecasts that the global market for general-purpose electronic T&M instruments will touch US\$ 6.8 billion by 2020. The Indian T&M market is driven by both global and domestic demand. Growth in the market is a factor of growth registered by key end-use segments like power, automobiles, electronics and telecommunication hardware.

Defence and other government sectors have also been instrumental in driving the growth of this sector. Increasing R&D activities across various industries, institutes and organisations are expected to further augment the same.

"There is steady growth of the T&M sector in India every year and we expect the sector to grow by minimum 15 per cent on year-on-year basis. Customers would prominently provide growth for players who are either enhancing the functionality of the product or coming up with most cost-competitive products in the market," states Narendra J. Goliya, chairman and managing director, Rishabh Instruments.

This growth will be driven by technological developments, expanding end-use applications, growing need for validating the functioning and performance of equipment and stringent quality, safety and environmental

standards for manufacturing, maintenance and use of equipment. While military and aerospace remains the primary end-use market, emerging applications in communications, semiconductor manufacturing, automotive electronics and IT hardware are poised to fuel future growth in the market.

"We live in an age of rapidly-evolving technology and

the T&M domain has continuously leveraged from and contributed to cutting-edge technology," opines Sudhir Tangri, country general manager, Keysight Technologies.

India growth story

Various initiatives flagged off by the government of India such as Make in India, development of smartcities and others will likely boost the power and communication sector in India and eventually contribute to the growth of the T&M industry.

"A big business opportunity is brewing for the T&M industry in India owing to various government initiatives such as Make in India and Digital India. There is optimism in the market currently and we have seen a number of policy developments that have brought back the trust in India growth story. Initiatives like Make in India, 100 smartcities, Digital India and defence manufacturing push will all have a positive impact on Indian economy in the days to come," says Tangri.

Make in India has already begun to witness a host of multinational companies and global manufacturing giants looking to set their base in the country. While commenting on related opportunities for the T&M segment, Tangri says, "We strongly believe in the bright future of defence manufacturing in India. As the government pushes for a comprehensive domestic defence manufacturing ecosystem, many of the global aerospace and defence giants have shown interest in our country."

"Coming to telecommunication and mobile, India holds huge potential. With Make in India creating a wave of optimism and opportunity, mobile manufacturing is all set to pick further momentum. We are looking forward to the burgeoning opportunities in mobile and aligned verticals," he adds.

Madhukar Tripathi, senior manager - marketing, Anritsu India Pvt Ltd, says "India is emerging as the manufacturing hub for mobile handsets and other consumer electronics

"There is steady growth of the T&M sector in India every year and we expect the sector to grow by minimum 15 per cent on year-on-year basis. Customers would prominently provide growth for players who are either enhancing the functionality of the product or coming up with most cost-competitive products in the market."
