

goods. Government's focus on Make in India is impacting T&M industry growth. We are witnessing demand from the mobile handset manufacturing market.

"Further, government's push to the defence sector will also create a positive impact on the T&M industry. Mobile service providers, cable TVs and broadcast market is expanding and we see some demand from these markets as well," he adds.

Power plays key role

As mentioned earlier, new government policies like Make in India, smartcities, Clean Energy and UDAY Scheme will encourage the power sector in India. This, in turn, will accelerate the growth of the T&M sector. Ajay Goyal, managing director, Megger (India) Pvt Ltd, explains, "Demand for electricity in the country has been growing at a rapid rate and is expected to grow further in the years to come. With growing demand, power generation, transmission and distribution companies will have to invest in reliable, accurate and efficient equipment to protect their assets from failures. Therefore growth prospects of the T&M industry seem very promising in India."

T&M equipment is required to ensure efficiency in generation, transmission and distribution of power. Narendra Goliya states, "We clearly see sufficient availability of power for all users across India and, hence, the new emerging area in the power sector would be quality of power. In times to come, attention of all power instruments users will be drawn to assured power quality. Ultimate performance of devices would depend on quality of power and, hence, manufacturers will have to produce equipment that will help analyse the same and subsequently improve on it."

Over the past decade, power companies have realised the significance of efficient testing practices and they have taken measures to make sure

"A big business opportunity is brewing for the T&M industry in India owing to various government initiatives such as Make in India and Digital India. There is optimism in the market currently and we have seen a number of policy developments that have brought back the trust in India growth story. Initiatives like Make in India, 100 smartcities, Digital India and defence manufacturing push, will all have a positive impact on Indian economy in the days to come."

—Sudhir Tangri, country general manager,
Keysight Technologies

"Demand for electricity in the country has been growing at a rapid rate and is expected to grow further in the years to come. With growing demand, power generation, transmission and distribution companies will have to invest in reliable, accurate and efficient equipment to protect their assets from failures. Therefore growth prospects of the T&M industry seem very promising in India."

—Ajay Goyal, managing director,
Megger (India) Pvt Ltd

that they procure the most-reliable equipment for testing. This has been the key driver that has influenced growth of the T&M industry.

Goyal says, "In order to avoid losses, transmission and distribution companies perform routine testing of their equipment. Such a change of trend has also influenced growth of the T&M industry. Insulation resistance testing and transformer testing are major demand-generating areas."

Automation is the new technological trend in the power sector and, hence, demand for automated products would grow. Accordingly, new technological advancements like data logging DMMs and auto power-calculating power clamp meters would show good growth. Online transmission-line-monitoring systems, compact Tan-delta testing machines,

automatic breaker testing machines, discrete monitoring of power loss at each feeder by DISCOM and others would be the key areas of interest.

Best practices in demand

Increasing awareness for predictive maintenance among manufacturers in India is also a driver for growth of the T&M industry. Continuity of processes has direct correlation with productivity of the organisation and, hence, predictive maintenance is gaining more and more importance, which, in turn, is driving the growth.

"Many OEMs have adopted best testing practices that again raise the growth level of the T&M sector. On the other hand, demand from customers to fulfill the needs of complex process issues is forcing T&M companies to innovate continuously. The result is development of high-end devices like power clamp meters/power-quality analysers with unique features and advantages are seen in the market," says Narendra Goliya.

Need for reliable and efficient testing practices is vital for maintaining equipment at sub-stations. Adoption of efficient testing practices is gaining importance along with routine testing. Multi-functional testing kits are the latest trend, which have stirred a lot of interest among the decision makers of maintenance departments. They have realised that if one kit can provide multi-functional testing capability, then they prefer it over using many different testing kits for individual applications. Such a tool saves time, money and most importantly, the effort that goes behind testing procedures. New instruments have a better graphical user interface (GUI) and provide ease of operation and automated testing, which increase productivity.

"Technology is changing in the direction of true root mean square (TRMS) readings, which give more correct values, made possible using microcontrollers and software," says
