

Fig. 6: Sound properties

Fig. 7: Accelerometer properties

Fig. 8: Final Blocks Editor

will need the following components: a button component to feel the touch, a sound component to play the sound and an accelerometer to detect the motion of the device.

Place these components on

Screen1, and the screen will look as shown in Fig. 4. You can also set properties for each component, like the button (Fig. 5), sound for the sound component that you can upload under media section (Fig. 6) and

Fig. 9: Theft Alarm app on the phone

properties for accelerometer (Fig. 7).

Now, open Blocks Editor by clicking Open Blocks Editor and place various tiles using the drag-and-drop function. The final block for Theft Alarm app is shown

in Fig. 8.

After setting all behaviours, your app is ready to be tested. To test your app on your smartphone, on Designer page, click Package for Phone and then Show Barcode. You will see a barcode on the screen; scan it with your phone. It will ask for login; once you enter your login credentials, you will be able to download and install the same.

But what if you do not have a smartphone to check the app? Do not worry because this tool provides an internal emulator that works exactly like your phone; you can run your app within the emulator. To run the emulator in Blocks Editor, click on New Emulator and then Connect to Device.

Hurrah! Your app is working! It will play a siren sound whenever you touch the screen with a mouse cursor.

If you have downloaded this app on your phone, you will hear a siren sound along with vibration when you lift up the phone or touch the screen.

Now, if you want your app to be published in Play Store, just create a Google Developer account (costs around US\$ 25 as one-time registration fee, and upload as many apps as you want. Fig. 9 is the screenshot of the same app uploaded on the mobile phone. ●
