

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM and LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

Facebook Internet drones to have wingspan bigger than a Boeing 737

Facebook CEO, Mark Zuckerberg, has completed the first test of an unmanned aircraft that could be used to bring Internet connectivity to the most remote parts of the world. The unmanned aerial vehicle has already gone on one test flight in the UK.

It is expected that the final design will produce an airplane with the wingspan of a Boeing 737 but lighter than a car. Running on solar power, Zuckerberg has said, it is expected that the plane could fly at altitudes of more than 18,288m (60,000-feet) for months at a time.

DARPA working on technology better than GPS

When your location marker on Google Maps is wiggling, it is usually due to a temperamental global positioning system (GPS) signal.

Defense Advanced Research Projects Agency (DARPA) in the USA is developing a radically new technology that will offer real-time position tracking; something that will work despite blind spots or jamming efforts. The agency expects this will offer a huge boon to the US military, especially. Beyond war, the technology is expected to be far more flexible than GPS.

It is also working on self-calibrating gyroscopes and accelerometers and clocks that will be able to track your position without relying on a wireless signal or other external sources. If your smartwatch of the future knows where you start and if you move 350 metres south, for example, it will know where you are, without having to double-check with the Internet or a satellite.

Aerospace-related technology could improve Parkinson's therapy

When Rice University chemist Matteo Pasquali set out to create strong and conductive carbon nanotube fibres, he had aerospace applications in mind. But it turned out that microscopic fibres are also great at
