

communicating with the brain, making these an ideal candidate for therapies that deal with neurological disorders such as Parkinson's disease.

At the moment, hard metal electrodes are implanted into the brain for Parkinson's therapy. The electrodes deliver electrical signals to calm tremors, but are not compatible with the organ's soft tissues. The flexible fibres are more bio-compatible, cheaper and maintain better electrical connection. Also, tests prove these cause little inflammation and are as stable as commercial platinum used on electrodes.

Rice University's assistant professor Caleb Kemere, who studies Parkinson's disease, believes that these fibres could lead to self-regulating treatment devices for patients. The devices will be able to read signals from the brain, analyse the best amount of electrical stimulation needed to calm tremors on a case-by-case basis and automatically administer jolts of electricity.

NASA to move asteroid into moon's orbit

NASA is planning to launch a rocket to an asteroid and grab a boulder off of it—a stepping stone and training mission for an eventual trip sending humans to planet Mars.

The space agency has unveiled details of the US\$ 1.25 billion plan to launch a solar-powered unmanned spaceship to an asteroid in December 2020. The ship would spend about an year circling the large space rock and pluck out a 3.9m (13-feet) boulder off its surface using robotic arms.

The smaller rock would be hauled near the moon and parked in orbit around the moon. Using a giant rocket ship and Orion crew capsule that are still being developed, two astronauts would fly to the smaller rock in 2025 and start exploring. Astronauts aboard Orion would dock with the robotic ship, make spacewalks, climbing around the mini-asteroid to inspect and document, and even grab a piece to return to Earth.

A cookie jar that lets you grab a cookie only when you achieve set goals

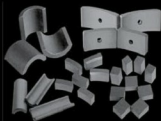

It is widely understood that delayed gratification helps one become successful. Resisting everything but temptation can be difficult, which is why kSafe is stepping in when your resolve weakens.

Essentially, kSafe is an oversized cookie jar, one that will let you get a tasty treat inside it only if you have achieved something that day. kSafe is the brainchild of Kitchen Safe inventors, Ryan Sang and David Krippendorf. kSafe takes the idea of locking your goodies away and takes it one step further, instead of just a time limit.

These goals are controlled by the safe's companion app and can be set to one of three different categories. Activity goals require you to walk enough steps or burn

Manufacturing and Supplying of HARD FERRITES Since 1984

Major Products:

- Magnetic Powder for Flexible Magnets
- Ring Magnets for Loudspeakers
- ARC Magnets for Automobiles
- Flat rectangular shaped magnets for various other applications

B-87, MIDC Ambad, Nashik - 422010, INDIA

Tel: +91 0253 2382238 / 67, Fax: +91 0253 2382926

For Enquiries: +91- 9960000811, Email: sales @deltamagnets.com

www.deltamagnets.com

Our Group Strengths:

- Capacity to fulfill customer requirements. (100% customer schedule adherence)
- Quality at par with international standard (Benchmarking with competition)
- Magnetic properties at par with international standard.
- Full fledged infrastructure and R&D set up to develop product.
- Providing magnetic solutions and customized magnets as per the requirements of our clients.
- Warehousing facility in UK

Manufacturing and Supplying of SOFT FERRITES Since 1978

All our core geometries are available in both
Manganese Zinc and Nickel Zinc material grades

Major Products:

- RM Cores
- Pot Cores
- PM Cores
- Rods, U & I Cores
- Planar Cores
- Blocks
- Bars
- Discs
- Toroids (2mm to 101 mm) with "UL approved Epoxy Coating" & Bead Cores etc.
