

Electronics Projects Vol. 26 is the latest volume in the series, available in digital form.

It is a compilation of 21 construction projects and 71 circuit ideas published in Electronics For You magazine.

This collection of tested circuit ideas and construction projects in a handy volume would interest all classes of electronics enthusiasts—be they students, teachers, hobbyists or professionals!

Electronics Projects Vol. 26 is available on the following digital magazine stores:

- www.lulu.com
- www.magzter.com
- pocketmags.com
- www.getscoop.com
- rockstand.in
- www.studybuddy.com
- www.readwhere.com

be calculated based on certain given inputs, for example, a churn score of 0.85 can be read as an 85 per cent chance of cancelling service.

Endpoint

While talking about data mining, we cannot ignore the popular buzzword of recent times—Big Data. Big Data slowly came to be differentiated from small data since it was not generated purely by a firm's internal transaction systems. It was externally sourced as well, coming from the Internet, sensors of different kinds, public data initiatives such as the human genome project, and captures of audio and video recordings.

Imagine this, UPS, the world's largest courier company, captures information on as many as 16.3 million packages, on average, that it delivers daily, and it receives 39.5 million tracking requests a day. The most recent source of Big Data at UPS is the use of telematics sensors in almost 50,000 company trucks that track parameters such as speed, direction and braking.

It is said that it is almost like there are two eras for organisations: Before Big Data, or BBD, and After Big Data, or ABD.

In BBD era, analysts spent much of their time preparing data for

analysis and relatively lesser time on the more important part, that is, the analysis itself. Most business intelligence activity catered to only what had happened in the past and offered no enlightenments or predictions.

The ABD phase began around 2005 when we saw several dotcoms or Internet based and social network firms come up, mainly in the Silicon Valley. These firms such as Google and eBay started gathering and dissecting new type of data.

LinkedIn, for example, today offers several value-added data products such as people you may know, jobs you may be interested in and so on. This is all a result of data mining.

As the Internet penetration increases and customers become more demanding, greater will be the demand on more sophisticated infrastructure, that is, hardware, software and apps.

Also, there will be a need for sharp and smart data scientists who can slice and dice the data in a number of ways.

We should not forget that companies like Google, LinkedIn, Facebook and Amazon became what they are today not by giving customers mere information but by giving them shortcuts to key decisions and actions that helped make their life better. ●
