

Thanks!

First, I would like to thank the entire team of EFY for publishing such a wonderful magazine, which not only keeps us updated with current technologies and gadgets but also solves our technical doubts and helps us with our projects.

'Some Amazing Products at CES 2015' article in February issue was awesome! I wish I could have gone to Las Vegas, the USA, to see such wonderful innovations.

I would also like to give some suggestions. Some students buy magazines that publish research papers. Is it possible for EFY to publish at least one research paper article in each issue?

Second, you can publish 'The Best of EFY' every six or 12 months, where only best articles, innovations, projects, gadgets, etc are published in a single book. Initially, you can give it for free as demo versions to get response from readers.

Presently I am pursuing BE in electronics. I am a hobbyist, who loves doing creative stuff in electronics. I would like to work with EFY on circuits, videos and uploading these online.

EFY: Thanks for writing in and sharing your feedback and ideas for Electronics For You and its online properties. We will review the idea about research papers and 'Best of EFY' (as a book) internally and decide which

From Facebook: EFY's Electronics Design Community

Hi EFY, I am a subscriber to both EFY and OSFY since last five years. I also subscribe to the e-magazine with Magzter Android app on my mobile. It is just great But I am unable to use it when there is no Internet. Since I have paid for five years for both the magazines, there should be an option to download these in PDF format that can be read offline with password protection.

Mehdi Krishan Butan

EFY: Thanks for the feedback! Your point has been forwarded to EFY management team for review.

☐ 'USB Power Socket' published in April 2009 issue of EFY is a very good one.

Christian Zongo

EFY: Thanks for the feedback!

ones can be executed.

With respect to working with EFY as a freelancer (since you are pursuing higher education right now), please share sample works that you would like to contribute. If our editorial team likes it, we could definitely start working together.

You can also send in interesting projects developed by you to EFY. If these are found suitable, we shall be glad to publish these.

Won First Prize!

I am a B.Tech (electrical and electronics) final-year student. I constructed 'Accelerometer Based Gesture-Controlled Robot' project taken from May 2013 issue of EFY. It worked well and I won first prize in the project fair event held at my college this year. I am very grateful to my project guide and EFY magazine!

EFY: Congratulations and thanks for the feedback!

Ultrasonic Radar

I am interested in 'Ultrasonic Radar Model Using Microcontroller ATmega128' DIY project published in February issue, but I am facing a problem with the sensor. Where can I get the 3-pin ultrasonic distance sensor? Can I use a 4-pin ultrasonic distance sensor instead?

Reyaz Alam

Through email

☐ I need software to program ATmega128 used in 'Ultrasonic Radar Model Using Microcontroller ATmega128' project. I am not able to get AVR Studio4. Can you send me the link from where I can download the software?

Saurabh Singh

Through email

The author Ashutosh M. Bhatt replies: The 3-pin ultrasonic distance sensor is available from www.sunrom.com/p/ultrasonic-distance-sensor-serial-out

This sensor gives the direct value of distance in ASCII format that can be directly displayed on the LCD. Yes, you can use a 4-pin sensor also, but in that case, the program will completely change. The 4-pin sensor gives pulse output, so you will need to do calculations.

The latest version of AVR Studio is available as free download on www.atmel.com. You can also search for AVR Studio on Google and download it from many other websites.

'Spot An Error' Award Winners

In 'Tech News' section in March issue, in the item 'Skin based device can now convert muscle movements into electricity,' in the second paragraph, the "which makes the device positively charged" line should read "which makes the device negatively charged."

Dheeraj Tripathi

☐ In 'Tech News' section in March issue, in the item 'Skin based device can now convert muscle movements into electricity,' in the third paragraph, the line reads "it produces 90V of current and 0.8MW of power." It should be "it produces 90V and 0.8MW of power."
