What users feel

Various testimonials written on the website of the software (logic.ly) suggest that both the academicians as well as the student community find this tool user-friendly and useful. While the software eased the effort of teachers to a great extent, students benefitted from the clarity and comprehension of ideas the software offered. "We started logic gates in electronics, and this software makes it really easy to have a play in my room without needing chips. So easy, I just picked it up and starting making stuff. I would recommend it to anybody wanting to play with logic gates," says Dan Collins, a student who uses this product.

"It is so nice to let students tinker in a simulation and then reproduce their work with a live circuit. It really helps them build confidence since they are not worried about electronic gremlins or other gotchas," points out Andrew M.C. Dawes from Pacific University.

Jassychad, a user from Hacker News community, says, "I wish this was around when I was learning because I really wanted to play with making more complicated setups than we did in class."

Let us play logic design

Logicly software was designed by Josh Tynjala, keeping budding engineers in mind. The student community could make some designs of their own, see the simulations, redesign circuits, obtain and compare results. The software allows them to understand the functionalities of each component and learn how the signal flows in the circuit. The use of such a logic-circuit-simulating software improves the level of confidence in young engineering minds, allowing them to design complex digital circuits. ●
