

Power MOSFETs

The Logic Level StrongIRFETs power MOSFETs from Infineon Technologies can be driven directly from a microcontroller, saving space and cutting costs.

These are highly rugged and thus help lengthen the service life of the electronic devices. Key features of the StrongIRFET family have been retained in the logic-level extension, which is, low on-state resistance (0.52mΩ typical and 0.97mΩ maximum) for reduced conduction losses, high current-carrying capability for increased power capability and rugged silicon for high system reliability.

Thermocouple-conditioning IC

MCP9600 thermocouple-conditioning IC combines precision instrumentation, a precision temperature sensor and a precision, high-resolution analogue-to-digital converter. It simplifies thermocouple designs by integrating a number of discrete devices into one chip, which also lowers board area, cost and power consumption.

Other features include a temperature-data digital filter, which minimises the effects of temperature fluctuations, system noise and electromagnetic interference. Its shutdown modes reduce overall system power consumption, while its four user-programmable temperature-alert outputs reduce the system MCU's overhead and code space.

COMPUTING SYSTEMS

Development board

The Microchip Technology Curiosity Development Board from Mouser Electronics uses Microchip's MPLAB X integrated development environ-

ment to simplify programming on the board. It harnesses the power of modern 8-bit PIC microcontrollers with low-voltage-programming capabilities. The layout and external connections provide easy access to the core independent peripherals that simplify the design and keep system power consumption and bill of material costs low.

Compact modules

The conga-TC170 modules, with COM Express Type 6 pinout, are equipped with ULV SoC editions of the sixth-generation Intel Core i3/i5/i7 processors. These offer a configurable thermal design power of 8.5W to 15W, which simplifies matching the application to the system's thermal design.

The power supply has also been optimised, which in addition to the new micro-architecture also contributes to the energy efficiency and allows a longer turbo-boost.

Computer on module

Toradex has announced a new computer on module (COM) based on Freescale's i.MX7 processor. The module offers a robust and secured platform for building products targeted toward Internet of Things (IoT)

applications. Using this COM, designers can leverage the asymmetric multi-core architecture on Freescale i.MX7 to develop products with excellent user-experience without compromising on real-time constraints.

LEDs

LED profiles

Kalpataru Industries have launched aluminium extrusion LED profiles in varied sizes from 5mm up to 100mm (width). The available lengths are

2m, 3m and 4m. These come with mounting options such as surface, recess, suspended, wall-mounted and enground (IP68-Drive-Over).

DC bus technology

The centralised driver-free low-voltage DC bus technology for safe and reliable LED lighting provides several advantages such as:

Increased reliability. Elimination of individual drivers obviates the need for maintenance at luminaire level

Fire safe. Suitable for hazardous operation areas, since chances of sparking at low voltages of 48V DC are reduced

Electrocution safe. SELV classified operation

Easy backup. In case of power failure, emergency backup is provided by a floating battery

Low-cost redundancy. Redundancy with auxiliary power supply

Easy implementation of intelligent lighting. Needs low-voltage DC
