

How Electronics is Helping in Sports

Dr S.S. Verma is a professor at Department of Physics, Sant Longowal Institute of Engineering and Technology, Sangrur, Punjab

In this fast-changing era of modern life, electronics play a key role in improving the quality of human life and also contribute to economic growth of the nation and world at large. Use of electronics and its devices has become a way of life and it is difficult to imagine any sector of human life that has remained untouched by its applications, and same is the case with sports.

Electronics not only plays an integral part in sports in its various domains like video games, sports electronics gadgets/equipment, sports venues, sports security, safety of players, time keeping and recording, event recording and its transmission but also in the improvement of sports personnel's lifestyle in terms of fitness, medical care and performance.

In this article, we have made an effort to introduce you to technology in general and how technology is making use of electronics, particularly in sports, in making a difference in the sports we play and enjoy today.

Electronic sports, also known as eSports or video gaming, is a term used for organised multi-player video game competitions. The most common video game genres as-

sociated with electronic sports are real-time strategy, fighting, first-person shooter and multi-player online battle arenas.

Sports venues of today have become much more than places people go to, to simply watch a game. These have been built, or modernised, to include high levels of technology for enhancing the overall experience for both the guests in attendance and for those viewing from the comfort of their homes.

Electronics in sports items feature the use of cutting-edge nanotechnology, making these ultra-lightweight with high-strength material and providing performance gains in acceleration, fuel savings, top speed and smooth handling. Additionally, the materials offer a shinier, gem-like finish that reduces surface tension on water, providing a more nimble, responsive ride.

Imagine, in the final seconds of a match, with a racing heart, we look towards the final outcome but miss the scene by a few seconds. The player also misses the goal by a few seconds, and centimetres. Despite replaying the moment over and over in the mind, the player fails to pinpoint exactly what went wrong.

Engineers and computing professionals are developing electronics based technologies to be used in sports that can provide sportspersons with just this kind of insight into their sporting performance. These technologies are making it possible for fitness enthusiasts and athletes alike to train smarter, perform better and play safer than ever before.

The number of sports fans watching events live on mobile devices has now reached a new high. But television remains the most-frequently-used content-consumption method for sports, recording a 90 per cent figure within the past 12 months, while 40 per cent people viewed or listened to sports online using a computer, tablet or smartphone and 19 per cent consumed
