

after execution of the main program code. Once compiled, it generates a class of the same file. But it is not so with JavaScript, which requires less space and is easily compatible with most of the latest Internet browsers including IE 6+ and NN/Mozilla.

Many clock projects using Java, C and C++ programs have been published in EFY. Here we describe a clock program that can display 150 time zones with live time and daylight saving time displays. Daylight saving time is a feature wherein the clock automatically adjusts the time in winters and summers mainly in the European and American continents.

The program

This program takes the Indian standard time (+05.30 GMT) as input and then calculates the time and accordingly increments or decrements the IST.

The time for each country is governed by an international time/date line that passes through Wellington, New Zealand. Greenwich mean time (GMT) originally refers to mean solar time at the Royal Observatory in Greenwich, London. It is commonly used to refer to coordinated universal time (UTC). GMT is five hours and 30 minutes late than IST. Each of the 150 time zones has been calculated using this standard. IST is calculated on the basis of 82.5°E longitude, which is just west of the Mirzapur town in Uttar Pradesh.

The `timezone()` function declares an array of parameters for the `worldtime()` main function. It has the following parameters: name of the time zone, time zone difference from IST (fast/slow) and daylight saving time. If daylight saving time is activated, it will run one hour slower than its summer time to compensate for the time lost in winter. The Indian subcontinent does not require this setting, so it is set to '0' in the program. The `timezone()` function also sends the colour parameter to `worldtime()` for the dashboard in the timetable as shown in program output screenshot.

The `ClockString()` function generates the time and date for `worldtime()` and `timezone()` functions.

To run the script on the system, the program searches for the necessary plug-ins that are add-ins for the Internet Explorer (IE) browser. ActiveX plug-in makes the main program access real-time-based system data like current date and time. To activate the JavaScript plug-in, proceed as follows: IE→Tools→Internet Options→Advanced→Security→"Allow active content to run in files/CDs on my computer".

BINAY LED-based Lights

PowerLED Street Light

PowerLED Night Bay Light
PowerLED Strip Light

BINAY-Lighting Up The Future

- Extremely low power consumption
- Long life (in excess of 50,000 hours)
- Models with light output to match conventional street lights
- No maintenance required: very low Lifetime Ownership Cost

binay opto electronics private ltd.
44, Armenian Street, Kolkata 700 001, India
Tel: (033) 2242 9082, 2210 3807, 2210 2039
