

INSTRUMENTATION May Be Instrumental

Are you at the edge of career selection? Perhaps 'manufacturing versus software' dilemma has driven you to a fix. Try Instrumentation. It will provide you not only a job related to lots of software application but also the opportunity to become a stakeholder in the futuristic manufacturing wave of India

Is there any common field across all manufacturing industries that is likely to demand the highest amount of investment and improvement in the next decade? The answer is instrumentation and control. As corporate majors try to increase productivity, one way they are likely to achieve this is through 'sensorisation' of all technologies ranging from food

processing to mining. Flexibility and efficiency are going to be the differentiators in order to quickly develop and manufacture an increasing number of products to meet the rapidly changing demands of the market.

If you are ready to master a subject that is essentially a 'mix' of many other subjects, 'instrumentation engineering' can provide you the right foothold for career in many industries. Moreover, with growing competition, "timing

and speed are going to become vital for survival and success of the future organisations. No organisation in today's age can survive without agility and responsiveness to changing environments. Systemic efficiencies can only be brought in and improved through control and instrumentation. With companies becoming more and more complex and dispersed, there is need for efficient manpower," says Sanjay Mittal, managing director, Yোগा Systems.

Know the field

India's manufacturing industry, which is spurring the country's GDP (gross domestic product) growth, is undergoing a major transformation. This sector is scaling up and beginning to seek global competitiveness through a wider application of instruments. This trend is contributing to the robust growth of the instrumentation and control market.

"According to a survey conducted by FICCI on 'Emerging Skill Shortage in the Indian Industry,' few sectors have been highlighted with shortage of manpower. Out of which, many cater to the need for instrumentation engineers alone. The shortage of instrumentation engineers is more due to less number of colleges offering B.Tech degree in instrumentation and control in India. Apart from this, automation
