STARTER KIT, PICKIT 2

The Pickit 2 starter kit is a low-cost, easy-to-use development kit for programming Microchip's 8-, 14- and 20-pin Flash microcontrollers. It includes everything needed to program, evaluate and develop the microcontrollers and helps the user to get up to speed quickly using PIC microcontrollers. The included instructions cover I/O, interrupts, A/D Converters, Data tables and Timers.

PROGRAMMER, AVR, MCU, ISP

The AVR In-System Programmer (ISP) mkII is used for field upgrades of AVR Flash microcontrollers. The AVR ISP mkII combined with AVR Studio can program new AVR 8-bit RISC microcontrollers with ISP interface.

DEBUG KIT, EXPRESS, PICKIT 3

This in-circuit hardware debugger/programmer for the PIC and dsPIC flash microcontroller families uses the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE) and connects to a PC using a full-speed USB interface and to the target MCU via an RJ-11 debug connector.

MODULE, BLUETOOTH, CLASS 1

The EBWT11-A Evaluation Board is ideal for evaluating the range and performance features of the WT11 Bluetooth Module. It can also be used as an additional board. This WT11 kit includes 1x WT11 Evaluation Board, 1x Power Adaptor and 1x Serial Cable.

DEVELOPMENT BOARD KIT, ETHERNET

This development kit provides a development environment for noninvasive real-time debug in the target system. The kit offers features and performance typically found on high-end development systems. These kits are complete with all hardware, software, cables and power supply. The user only needs a PC running Windows (95/98/Me/NT) with a free COM port. The kits include advanced debug features enabling the user to fully develop and integrate the hardware and software design as well as built-in debug capabilities, meaning the development environment can be used with devices already installed in the end application.

CABLE, PROG DOWNLOAD, PARALLEL PORT

- The cables drive configuration data from your PC to the device on the PCB, meaning design changes can be downloaded directly to the device.
- These allow for easier prototyping and also multiple design iterations in quick succession.

DEVELOPMENT KIT, DEBUG TOOL

The AVR JTAGICE mkII is a powerful development tool for on-chip debugging. It can be used with all AVR 8-bit RISC microcontrollers having IEEE 1149.1-compliant JTAG interface or debugWIRE interface.
