Logic Analyzer : The need for validating the dynamically evolving technology becomes stronger by the day. Whether it is the most basic signal or the most advanced serial bus, it is essential to ensure that your DUT performs up to the functional standards. A Logic Analyzer is a tool that helps you functionally validate your design, whether it is basic or niche. This device is used profusely in both the FPGA and the ASIC domains to validate the functionalities of technologies that include Low Speed Serial Buses as I2C, SPI, CAB or technologies as DDR, FSB, PCIE SATA and FBDIMM to name a few. While an oscilloscope lets you look at the parametric characteristics of a signal, it is limited to monitor only 4 analog signals. A Logic Analyzer theoretically lets you monitor any number of signals.

We also have rate contract for E8257D (250kHz to 20GHz), EXA9010 (13.6GHz and 26.5GHz) and U2000A.
