

Satisfy all Your High Speed Load Simulation Needs

PROGRAMMABLE D.C. ELECTRONIC LOAD

PEL-2000 Series

The Sequence function of PEL-2000 Series allows each channel to change its load sink according to a predefined sequence at a rate of up to 100 μ s per step. Each sequence is able to run concurrently, under the control of one clock. This is one of the most powerful features of the PEL-2000 Series as it is able to realistically simulate a multi-output power supply load. Under Dynamic mode, the load current or load resistance pulses between two preset levels at a pre-defined speed up to 25 μ s per step. This is often used as the standard test procedure to verify the response of a power supply to quick load changes. Most remarkably, multiple load channels can be connected in parallel to run Dynamic tests synchronously under a single clock. This Parallel Dynamic functionality gives the flexibility to perform dynamic tests for a high-power power supply without the need of another high-power load. For higher load capacities, mainframes can be linked together in parallel with standard MIL 20-pin connectors. A maximum of 5 mainframes, including one master and 4 slaves can be chained together to create a total load capacity of 7kW for high current and high power applications. Using 4 dual channel load modules, the PEL-2004 is able to test 8 power supply outputs simultaneously.

FEATURES

- Sequence Function to do High Speed Load Simulations
- Flexible Configuration with Mainframes and Plug-in Modules
- Multiple Independent Load Inputs up to 8 channels in a Mainframe
- Parallel Connection of Inputs for Higher Load Capacity
- Program Mode to Create Work Routines for Repetitive Tests
- OPP/OCP/OVP/OTP/RVP/UVVP Protections
- External Channel Control / Monitoring via Analog Control Connector
- Multiple-Interface USB Device / Host, RS-232C, and GPIB (Optional)

Multiple-Load Sequence to simulate a multi-output power supply load

The figure above shows the current waveform of a simulation using the sequence function.
