

Rigil

Rigil in collaboration with
Hongshang offers Heat Shrink
Solution for diverse range of
Electronic applications.

Innovative Insulation Ideas...

... Heat Shrink Technology

Product range:

- Ultra Thin Wall Heat ShrinkTubing
- Thin wall & High Shrink Ratio Heat Shrink Tubing
- Dual Wall Heat Shrink Tubing
- High Temperature & Chemical Resistant Heat Shrink Tubing
- Teflon Heat Shrinkable Tubing

of which responds to certain bands of sound frequencies. Different combinations of the sensors are activated to differing degrees depending on where the arm is tapped.

The system could use a wireless technology like Bluetooth to transmit commands to phones, iPods, PCs and other devices.

Send data through your body

If your Internet connection is currently unavailable, you may try sending data through your body. This has already been tested by researchers at Korea University, Seoul. They transmitted data through a person's arm at a rate of 10 megabits per second by placing two electrodes 30 cm (12 inches) apart on his skin.

A network transmitting through the skin would cut energy needs by roughly 90 per cent, claim the researchers. The most interesting applications would be in the medical field, where it could help measure blood sugar and electrical activity of the heart.

Programmable ZigBee module

Digi International claims to have introduced the industry's first foolproof programmable ZigBee module for easy and safe ZigBee application development. Customer applications can be programmed directly on the XBee-PRO ZB module, eliminating the need and cost of a separate processor and reducing time-to-market.

Because the wireless software provided by Digi is isolated, customers can develop applications with no risk to RF performance and security. They can also use the iDigi platform to easily integrate XBee ZigBee endpoints into their systems.

A product designed using the programmable XBee-PRO ZB can be updated remotely with new ZigBee profiles, feature updates or security enhancements.

RFID tags may replace bar codes

Rice University researchers, in collaboration with a team at Suncheon National University in Korea, have developed an inexpensive and printable transmitter that can be invisibly embedded in product packaging. The new technology, if adopted, will allow scanners at super markets to read all items in the shopping cart, total them up and charge the customer's account while also adjusting the store's inventory—all at once. It has the potential to replace bar codes and make check-out procedures at stores easy for shoppers.

Unique clock radio

Sony has launched a clock radio with a built-in projector that displays time on a bedroom wall. The ICF-C71PJ also comprises a built-in thermometer to display room temperature and has five nature sounds programmed in it to help users relax before going to sleep. You can set the projector at different angles according to the wall, and it can even show the time on the ceiling.

Sony ICF-C71PJ clock radio

The dual alarms can be set to play an AM or FM radio channel, a buzzer or digital music from an iPod or other digital media player. Nature sound choices include undersea world, waves, mountain brook, rainfall or a birdsong.

Digital cameras to have quantum film

Quantum film—a material like the conventional film—will soon replace the CMOS image sensors in digital cameras. The new polymer has embedded particles called quantum dots that give a very high pixel resolution, claim
