

website translation widget. Every day, thousands of new users visit the site to twist phrases, sayings and song lyrics—whatever the case may be—with Funny Translator's surprisingly-bad translation service, which can then be tweeted and shared on Facebook for the amusement of friends.

The results are always bad, often humorous, and occasionally even surprisingly insightful or ironic, such as when a user evidently entered "I wish I was cool," 56 translations later, the site spat out: "I pray for you."

The project was started to emphasize how bad machine translation is. By revealing the limitations of automated translation services such as Google Translator and Yahoo! Babel Fish, the hope is to promote the need for high-quality, human translations for important texts such as legal documents, corporate websites and instruction manuals.

Turn your mobile into a PC remote control

The Gmote server application for your Android phone, once installed, can turn the phone into a remote control device for your PC, allowing you to control playback of music and movies and browse your file system on the PC. You even use your phone as a keyboard and mouse.

To get the media playback controls working, you need to make sure that your PC has the VLC player and Gmote server application installed—there are versions for Windows, Mac, and Linux. Then install the Gmote client on your phone. Once you've completed the setup, connect the mobile client to the Gmote server by IP address, and start controlling your PC from your phone.

Gmote is a free download for Android, Windows, Mac and Linux.

DRAM module without heat-sink

KINGMAX has announced a 2400MHz DDR3 module without the traditional

Gmote server application for Android phone

heat-sink. Instead, it uses nano thermal dissipation technology to provide higher performance and economical power.

Compared to DRAM modules equipped with the normal heat-sink, KINGMAX DDR3 offers the advantages of lighter size to provide more convenient space to arrange other components and the no-power-request design to offer economical operation than those needing external power for fans.

The DRAM adopts a nano-size thermal-dissipation silicon compound to increase the release of radiant heat. The compound fills up the invisible vacant space of the smooth surface to remove the surface heat quickly. It is like a sponge that pulls the heat and releases that into the air at a faster rate than normal products by itself.

Intelligent transport system

Karnataka State Road Transport Corporation (KSRTC) is all set to introduce

an intelligent transport system (ITS) in Mysore in its local transport services. The project is funded by The World Bank.

The ITS provides for dynamic passenger information on public displays at bus stops, bus terminals and even the Internet. One could plan to take a bus knowing in advance the exact time when the bus would arrive at the bus stand, the availability of seats and the time it would take to reach the destination.

These new services based on GPS-enabled navigation systems and supported by information and communication technologies will also help KSRTC in running its operations most efficiently. Supported by a two-way voice communication facility, the driver and the central control station could be in constant touch on such issues as road traffic-jams, incidents and accidents, and route diversion in case of emergencies.

India's first Web browser

Hidden Reflex, an Indian start-up, has rolled out the first Web browser for India. Based on the open source Mozilla platform, the Epic Web browser comes with a host of features and claims to offer ease of use.

India is the primary focus of the browser; its India sidebar supports Indian content by providing users access to the latest national and regional news from popular publications, live television channels, videos, stock quotes, live cricket scores, top music albums and local events. It currently supports twelve Indian languages.

Epic is claimed to be the first browser to include a suite of productivity applications including a free wordprocessor, video sidebar (picture-in-picture functionality), communication applications like Facebook and Twitter, My Computer file browser, and 1500+ free, user-installable sidebar applications in the Epic Apps Store.
