

T&M in Mission-Critical Aerospace and Defence

Get it right, first time, every time!

As public-private partnership in aerospace and defence catalyses indigenous design and manufacturing, test and measurement holds great potential from design to delivery in the Indian strategic electronics market. Test and measurement manufacturers provide sophisticated, state-of-the-art solutions to ensure quality and reliability of these equipment

Aerospace and defence systems are very typical in nature and custom-built to serve the very purpose of the industry. To satisfy their stringent testing requirements, the test and measurement equipment need to be highly accurate and reliable.

The increase in indigenous design and manufacturing of aerospace and defence systems has resulted in a rise in the demand for high-performance, state-of-the-art test and measurement equipment. With public-private partnership initiative, there is a demand for commercial off-the-shelf (COTS) equipment satisfying military (MIL) standards in the strategic electronics segment.

"T&M equipment and solutions for aerospace and defence are based on advanced technology for their use in radar, electronic warfare, military communications, satellites, guidance, avionics, intelligence, surveillance and beyond," shares Gautam Awasthi, general manager-marketing, Agilent Technologies.

"Cutting-edge technologies and advanced applications are very important for aerospace and defence, as the risks are high in these sectors. State-of-the-art solutions in T&M are available to analyse threats, signal integrity and

frequency hopping in radio signals," says Naresh Narasimhan, pacific technical marketing manager, Tektronix.

"Generally speaking, the requirements for military/defence and commercial aerospace projects are quite similar. Whenever health and safety are involved, the requirements are set at the highest level independent of the market being addressed," informs Jon Semancik, director of marketing, VTI Instruments.

Adds N.V. Valsalan, director-business development, T&M and broadcast, Rohde & Schwarz, "Equipment

manufacturers work collaboratively with the aerospace and defence industry to bring focused solutions that meet the exact requirements."

Modular instrumentation and open standard instrumentation interfaces ensure availability of a wide range of commercial-off-the-shelf solutions for test and measurement in this segment. Today, a number of solutions are based on LAN extensions for instrumentation (LXI) and synthetic instruments (SI) that shrink test systems and enhance their longevity. Modular systems
