receives its own image. Because each of your eyes receives a separate image, your brain perceives 3-D," explains Mahesh Bhalla, executive director and general manager, consumer division, Dell India.

ATI Radeon graphics card too is a good choice.

"Some OEMs of 3-D laptops sup-

ply glasses with their laptop. Else, you will have to buy them separately. Glasses from reputed brands cost between Rs 5000 and Rs 10,000. For example, Nvidia glasses may cost about Rs 8000. The overall system cost becomes cheaper if glasses come bundled with the laptop. The screen accounts for most of the cost," informs

## What is 3-D and how does it work?

You've probably heard of 3-D as a certain type of movie you see in a theatre where things appear to look like they jump out at you. By sending different visual perspectives to your right eye and left eye, 3-D creates the illusion of depth when you're wearing the provided glasses. The extra dimension of depth gives you the sense that you are right in the middle of the action and the objects in the movie can sometimes look like they are moving towards you off the screen. Thanks to modern technology, 3-D is no longer limited to just movie theatres. With the right media, equipment and accessories, 3-D PC games or movies can now be experienced at home.

The best applications for 3-D are PC games because many already have 3-D information inside them. Using 3-D programming interfaces, developers have been creating PC games suitable for 3-D displays for over two decades. Until recently, gamers have not been able to view them in 3-D because the components were either too expensive or complex to set up. However, now there are inexpensive 3-D display options, enabling PC games to be viewed in 3-D and played in their true 3-D form.

The vast majority of PC games today support 3-D technology. This does not include casual PC games like those on Facebook or Bebo. For console gamers, the first wave of 3-D games is just starting to come to market. The PC games that support 3-D technology are those that are typically sold in retail stores or are downloaded and installed on a PC. Both require a DirectX or OpenGL graphics card to play.

There are two types of 3-D glasses: simple plastic glasses with special lenses and complex electronic shuttering glasses. The choice between the two depends on the type of 3-D monitor you choose. Once you freeze the type of glasses, consider how comfortable the glasses are, what your budget is and how you plan to use them. A
