

Learn More And Have Fun With **FPGAs**

Today's field-programmable gate arrays (FPGAs) combine the logic blocks and interconnects with microprocessors and peripherals. These have led to the development of a complete system-on-a-programmable chip. If you are excited about experimenting with FPGAs, new offerings from vendors, tools for designing and projects based on FPGAs, following websites may help!

FPGA Central

FPGA Central provides a central place for FPGA and CPLD vendors and users to share experiences and information about FPGA design, development, verification, validation, process, tools and products. The website claims to be the world's first portal on FPGAs and CPLDs. You can create your user ID and password to access the information on this website (tutorials, vendor information, etc) and participate in technical surveys, blogs, etc.

FPGA 4Fun

This website is created by Jean P. Nicolle who believes FPGA is a wonderful technology but can be intimidating. As many FPGA vendors are providing affordable parts and free tools, this is the right time to learn, claims Nicolle. FPGA4fun provides you information on FPGAs and FPGA projects to build with an FPGA board. It provides great examples and a great learning experience for beginners as well as professionals. The website reflects the author's experience and opinions on FPGA technology.

FPGA Related

This website connects to all the information related to FPGAs. You can create a login to post new content or rate existing content on this website. The blogs and articles are categorised into various sub-heads for easy browsing. Another tab Comp.Arch.FPGA is a worldwide Usenet newsgroup that is used to discuss various aspects of FPGA-based computing systems development. This website provides you with the information on FPGA books, their reviews and prices.

FPGA Arcade

If you are a hobbyist or gamer who likes to play with electronics, some of the interesting experiments, views and comments may help. This website is about recreating gaming hardware from the past in modern programmable devices, known as FPGAs. The latest variants of the Opencores T65 and T80 CPU cores can be found on the Library page. You can buy modules that drop into old arcade boards and replace Namco/Konami/Commodore 64 custom ICs as well as standard TTL chips. The rest of the site contains the code for a number of classic games/systems that can be run on off-the-shelf FPGA boards.
