

Fertility and Sterility.

"I wouldn't say that if someone starts to use laptops, they will become infertile," added Sheynkin, though he warned that frequent use might contribute to reproductive problems because the scrotum doesn't have time to cool down.

Organic radical battery

NEC Corporation has developed a thin and flexible organic radical battery that is significantly more reliable and produces 1.4 times more output than existing units.

NEC organic radical battery

The prototype battery maintains nearly full capacity, even after repeated charge-discharge, due to anodes that feature the same carbon material as lithium-ion batteries. It produces a higher output due to the use of highly conductive cathodes. Furthermore, this battery is the size of a coin, 0.7mm thin and has a capacity of 5 mAh.

The prototype battery enables more than ten consecutive flash firings approximately 20,000 times, and facilitates continuous high-luminance LED flash emission, which is difficult to perform on compact double-layer capacitors. It is suitable for next-generation ubiquitous terminals that require flexibility and high output, including IC cards, wearable terminals and flexible electronic paper.

Will TV remote control be history?

The standard TV remote control which we lose often may soon be a thing of the past. Smartphones and tablets allow you to control the TV with their applications. People are using iPhone

to control Apple TV set-top boxes and to search for things to watch. Moreover, TV viewing habits are changing as more Internet and on-demand content like YouTube videos, streaming movies, shopping sites and Facebook photos flow directly onto big screens. There are many new demands from a remote control, including a fair amount of typing, which current remotes cannot handle.

Says David Mercer, a television analyst at Strategy Analytics, a research and consulting firm, "The cable companies and the TV manufacturers are beginning to realise that they have to start moving away from the traditional, basic remote control."

But integrating too many features into a remote can make it both expensive and physically imposing. A better alternative would be to simply replace the remote with smartphone apps. If there is a specialised smartphone app to control a TV or set-top box, manufacturers can pack the phone's touch screen with virtual buttons in any configuration they like.

Google's new phone to replace credit cards

Google is poised to launch a new mobile phone having a near-field com-

munication (NFC) chip. The phone, believed to be branded as 'Nexus S,' was unveiled by Google CEO Eric Schmidt while addressing the *Web 2.0 Summit* held in San Francisco.

The phone runs on Android 2.3 (Gingerbread), which would carry built-in support for near-field communication technology. This technology embedded with NFC supporting chips will enable the phone to send out information at short distances of up to 10.2-15.2 cm, thereby facilitating financial transactions and location-based services.

The chip is said to be safer and more secure than the magnetic stripes technology.

Fastest supercomputer

The Tianhe-1A system (meaning Milky Way) at the National Supercomputer Center in Tianjin, China, has been ranked as the world's fastest. It achieved a computing speed of 2570 trillion calculations per second in a Top 500 survey of supercomputers.

The Tianhe-1A uses 7168 NVIDIA Tesla M2050 GPUs and 14,336 CPUs to achieve this mind-blowing performance. It takes almost 4.04 megawatts to run this machine in full swing, which means it consumes a lot of pre-
