

Smaller than a normal electronic car key, ZOMM features a single button for ease of use and LED lights for visual notifications. It uses a lithium-ion battery with a single charge lasting approximately three days. It also comes with a standard micro USB wall charger, a micro USB charger that connects with any computer (for updates and activation) and optional clips for ease of use.

Internet-savvy cars

US automaker Ford has expanded its 'in-car connectivity' by bringing Internet services on the wheel. Now a Ford commuter can listen to tweets, Internet music and news stations just by touch or voice commands. The system, known as Sync, has been developed with software giant Microsoft, and also gives traffic reports, navigation information and even a health report on the state of the car.

Access Facebook via Yahoo! Mail

In order to make Yahoo! Mail more interactive and offer users the experience of social networking over e-mail, Yahoo! plans to integrate with Facebook and Twitter by 2010-end. This will enable users to connect with Facebook friends on Yahoo!, view a feed of their friends' related activity on Yahoo! and share content—such as photos from Flickr or comments on

news stories—with all of their friends on Facebook. The content that consumers share with Facebook friends will then create a loop that drives visitors back to Yahoo.

Android 2.1 released

The Android 2.1 is a minor release that is deployable to Android-powered handsets. It includes new API changes and certain bug fixes. The Android 2.1 is available for developers and the downloadable version includes a fully compatible Android library and system image, as well as a set of emulator skins and sample applications. Developers who want to get started with testing of the Android 2.1 platform can use the Android SKD and AVD Manager tools to download the platform into their Android SKD.

Now Android OS in microwave ovens

Google's Android operating system has already been used in smartphones and even futuristic tablet PCs. Now a company called Touch Revolution has showcased a microwave oven as well as a washer dryer that uses Android OS. The OS will help users in perfect cooking settings for various dishes and also offer feedback on the dishes made.

Virtual hard drive in cloud

Instead of carrying a USB drive, you can now use Google Docs for access-

ing your files on different computers. This is possible with Google Docs giving you one place where you can upload and access your key files online. Because Google Docs now supports files up to 250 MB in size, which is larger than the attachment limit on most e-mail applications, you'll be able to backup large graphics files, RAW photos, ZIP archives and much more to the cloud.

This feature can help you work with teams to organise and collaborate on information online. For example, an architect can share large schematic files with his construction firm. You can even add these files to the shared project folder that your team has already been using to collaborate on documents and spreadsheets.

Pico projectors

Though still a rarity, pico projectors are set to become the next big technology wave with players hoping to embed the technology in a range of consumer electronics including cameras and phones. At the recent *Consumer Electronics Show*, Microvision showed off a standalone projector that looked like a big bar of soap and projected crisp video images using laser technology. Other players like Texas Instruments and 3M Co are also promising strong prospects for pico projectors.

since more than 75 years.

Network analyzers

Easy-to-use modular solutions up to 325 GHz with unique measurement capabilities

Power meters

Extremely fast, accurate and versatile instruments from the pioneer of USB power sensor technology

EMC test solutions

Full range of instruments and systems from test receivers to software to complete turnkey test chambers
