

Blue eye camera from Mark India

standalone DVR. DVR cards are outdated, power consuming and prone to virus issues."

Cameras come in various shapes and sizes. There are various cameras that look like smoke detectors. Also, there are cameras that work as smoke detectors as well. Cameras can be mounted on wall or placed on table. Cameras having fixed angle can cover only a limited area. You can go for cameras that can rotate so that a large area can be scanned.

Security for offices

Offices require security systems to check identification theft, safeguard important documents, maintain authorised entries to labs and server rooms, keep an eye on employees and, last but not the least, ensure security of digital content.

There are various products available today that can stop identification theft. Earlier, there were registers where one had to sign in for attendance and produce identity cards for verification. All of these could be faked. Then came electronic cards that had to be punched in order to log attendance. But those too could be faked. Today, we have various biometric systems like fingerprint readers and retinal scanners that can be used to prevent identity theft.

One of the new inventions in biometrics is vein identification. Veins are unique for everyone and hence vein

identification can stop identity theft altogether. Although fingerprint biometric devices are said to be safe, these can be faked with an impression of the finger.

On the other hand, it is almost impossible to duplicate an individual's veins.

Security cameras with DVR recording are very popular in offices. These keep surveillance of all public areas and help prevent and solve most thefts and petty crimes. Though such equipment is largely imported, there are many agencies who install and maintain them.

Data transactions are done over the Internet. But, the Internet is not safe and is prone to intrusion. Unauthorised users or hackers make their way into various networks and pilfer important data. Therefore enterprises need to deploy suitable security solutions to keep their data safe. There are various companies that provide security solutions for individual PCs and small to big enterprises.

The industry faced many challenges in the year 2009. Arvind Abhinav Kamwal, product marketing manager APEC, Trend Micro, says, "The Internet today offers wider and deeper online social networks, new and possibly landscape-changing technologies from application to infrastructure level—like cloud computing, IPv6 and virtualisation—along with more insidious challenges to security. These challenges are propelled to a certain extent by cybercriminal efforts to obtain profit." This year we may witness attacks on social networking sites as these have lots of users and new attack vectors for

virtualised and cloud computing environments. Windows 7 will have an impact as it is less secure than Vista in the default configuration.

Security for automobiles

Automobile theft has been a major issue for the last few years. A security system installed inside a car can detect the intrusion threat and sound an alarm to alert the car owner. But even after equipping the car with various security devices, it might get stolen. So some state-of-the-art security product needs to be installed in the car that can tell where the car is even after it is stolen.

Also, there are security systems that send a message to the car owner in the event of an intrusion. The device basically has a central processing unit (which is connected to the vehicle) and a GSM SIM card inside it for the purpose of locating the car. Also available are security systems that let you locate the stolen vehicle, enable or disable the vehicle over the Internet and fully configure the device through the Web.

A perfect combination

Which security system should you choose, or what combination should you apply for the best security? Well, for an independent house, intrusion detection alarms and cameras at different locations should do the trick.

Also, a few panic switches placed at various locations can help detect intrusion. For builder apartments, audio/video doorphones can be used to check who is at the door before opening it. If you have an elderly person at home, panic switches can be installed in the house. The switches, when pressed, will automatically call
