

Screenshot 7: Pasting the photo into MS Paint

it as 'VMdata.mdm.'. Then create three tables in design mode and name them as 'psdetails', 'candtable' and 'elroll' as shown in Screenshots 3, 4 and 5, respectively.

**Entering the data.** Open each of the tables individually and enter the data. Normal data can be entered easily; however, the OLE field data must be entered as shown in 'vtrphoto' field of table elroll. 'vtrphoto' field is defined as an OLE object, and you need photo image copied into this field. For this, right-click the field and select 'insert object' option as shown in Screenshot 6. Then select 'create new' and 'bitmap image' options and click 'OK' button.

In the MS Paint screen, paste a photo file from 'edit' option as shown in Screenshot 7. The photo is saved in the table automatically. In a similar way, copy bitmap images to other records too.

Next, open 'candtable' and enter the data. The data can be entered in a usual way. To copy photo into 'party symbol' field, follow the above procedure. Close MS Access and the data is saved in 'VMdata.mdb' database file.

**Establish ADO and RDO connections.** The steps for establishing ADO

Click 'new' and select 'Driver do Microsoft Access' option. Click 'next.' Type the file name as 'EFYEVm' and click 'next' followed by 'finish.' Then select the database file (VMdata.mdb) as shown in Screenshot 9.

Select DSN name as 'EFYEVm' and click 'ok' as shown in Screenshot 10.

You can test the connection by clicking 'test connection' button. Otherwise, click 'ok' button to proceed.

After the connection is established, set the properties of 'adodc1' control as follows:

```
CommandType = adCmdText
CursorType = adOpenDynamic
LockType = 3-adLockOptimistic
Mode = 3-adModeReadWrite
RecordSource = -From elroll
```

**RDO connection.** For MSRDCl connection, copy text from 'connection string' property of 'adodc1' control and paste in 'connect' property of MSRDCl. Retain only the following information from text by deleting the remaining text:

```
Provider=MSDASQL.1;DBQ=E:\EFYEVm\
VMdata.mdb;Driver={Driver do
Microsoft Access (*.mdb)};
DriverId=25;
```

Also change the properties of MSRDCl as follows:

and RDO connections are detailed below.

**ADO connection.** On form1, click 'adodc1' control followed by the button against its 'ConnectionString' property. Click 'build' as shown in Screenshot 8. Then select 'Microsoft OLE DB provider for ODBC' from 'provider' option and click 'Next.'

```
CursorDriver = 0-rdUseIfNeeded
DataSourceName = MS Access Database
LockType = 3-rdConcurRowver
Prompt = 1-rdDriverNoPrompt
In SQL property type - Select * from
candtable
```

## Program code

The program code is mainly associated with click events of command buttons. Initialisation of the program is associated with the form load event:

```
Private Sub Form_Load()
STRTPoll.Enabled = False
STOPPoll.Enabled = False
POLLFRAME.Enabled = False
RESULTS.Enabled = False
BUPFrame.Enabled = False
CHKTOTAL.Enabled = False
Initialdata
End Sub
Private Sub Initialdata()
Adodc1.RecordSource = "select *
from psdetails"
Adodc1.Refresh
Adodc1.Recordset.MoveFirst
pstotvoters = Adodc1.Recordset.
Fields("totvotes")
mvotes = Adodc1.Recordset.
Fields("castmvotes")
fmvotes = Adodc1.Recordset.
Fields("castfmvotes")
totvotes = Adodc1.Recordset.
Fields("casttotvotes")
stmvotes.Text = mvotes
stfmvotes.Text = fmvotes
stpvotes.Text = totvotes
stpvotes.Text = Round(totvotes /
pstotvoters * 100, 2)
End Sub
```

The photo, name and serial number of the candidates can be displayed in the ballot unit by the code associated with the click event of 'power on' button. Also, whether the poll is conducted or not is tested by the data stored in
