

Screenshot 8: Connection string property dialogue box

'pollconducted' field. If it is set to false, the code allows voting. If it is set to true, the program does not allow voting but the result is displayed.

The following code reads and displays the keys pressed in the serial number field continuously until 'OK' button is clicked:

```
Private Sub SNKeys_Click(Index As Integer)
    KdNums.Text = KdNums.Text + Chr(Index)
End Sub
```

The voter is identified when 'OK' button is clicked. The code associated with the click event of 'OK' button finds the voter's record in 'elroll' database table. If correct record is found, the program prompts voter to enter special identification number by displaying "Allow special ID check." Otherwise, it displays the message "No matching voter found."

The ID number entered is verified by matching it with the numbers in the database. This is done by the program code associated with voterspid_change() event:

```
Private Sub VOTERSPID_Change()
    If pidlen = Len(VOTERSPID.Text) Then
        If Trim(Adodcl.Recordset.Fields("perid")) = Trim(VOTERSPID.Text) Then
```

```
MsgBox "Matched allowed to vote",
vbOKOnly, "VOTER IDENTIFICATION"
' enable voting buttons
For i = 0 To 2
    VTBUTTON(i).Enabled = True
Next i
Else
    MsgBox "Not Matched donot allow to vote", vbOKOnly, "VOTER IDENTIFICATION"
    VOTERSPID.Text = ""
End If
End If
End Sub
```

If the number is correct, it displays the message "Matched—allow him to vote" and activates the voting buttons. If not, it displays the message "Not Matched—do not allow to vote." The voter can enter the special identification number any number of times. However, you can cancel his voting by pressing 'CL' button and allow a new voter to vote.

The code associated with the click event of voting button (vtbutton_click) saves the data:

```
Private Sub VTBUTTON_Click(Index As Integer)
    Dim k As Long
    Dim mynum, tempno As Integer
    Adodcl.RecordSource = "select * from candtable"
    Adodcl.Refresh
    Adodcl.Recordset.MoveFirst
    mynum = Index + 1
    Adodcl.Recordset.Find ("&candSRno &" & mynum & "")
    If Adodcl.Recordset.EOF = True
        Then
            MsgBox "ERROR"
```

```
Exit Sub
Else
    k = 10
    While k > 1
        Beep
        k = k - 1
    Wend
    Shapel(Index).FillColor = vbRed
    'Beep
    tempno = Adodcl.Recordset.Fields("castvotes")
    tempno = tempno + 1
    Adodcl.Recordset.Fields ("castvotes") = tempno
    Adodcl.Recordset.Update
    'update electroll roll and votes
    Adodcl.RecordSource = "select * from elroll"
    Adodcl.Refresh
    Adodcl.Recordset.MoveFirst
    Adodcl.Recordset.Find ("sno =" & MYNSO & "")
    If Adodcl.Recordset.EOF = False
        Then
            Adodcl.Recordset.Fields ("votestatus") = True
            totvotes = totvotes + 1
            VOTERSPID.Enabled = False

            If Adodcl.Recordset.Fields("sex") = "M" Then
                mvotes = mvotes + 1
            Else
                fmvotes = fmvotes + 1
            End If
            If Adodcl.Recordset.EditMode = adEditInProgress Then
                Adodcl.Recordset.Update
            End If
            End If
        End If
    End If
    ' enable voting buttons
    For i = 0 To 2
        VTBUTTON(i).Enabled = False
    Next i
```

More and more IT Managers are adopting Open Source. What about You?
