Cost: Rs 18,400 and Rs 16,990 in Maharashtra and the rest of India, respectively.
Warranty: 1 year
Availability: Bright Point (I) Pvt Ltd, New Delhi

a priority, the Internet has emerged as an important interface through which one can stay connected to the outside world—friends, family, workplace, etc. But most of the times it is not possible to carry along a laptop wherever we go. So, what's the alternative? The answer is smart phone.

What is a smart phone?

Smart phone is a device that has features of two devices embedded into one. It has the capabilities of a general mobile and quite a few features of a PDA. Smart phone is generally more

expensive than a normal mobile phone and costs you around Rs 15,000 and above. It comes in various shapes and sizes. So, choosing a design according to your taste is an important consideration. Certain smart phones may have the slider functionality, while others may have the candy bar look. Thus, depending on the taste, you need to decide which form factor suits you the best.

If you are not tech savvy, or most of your time is not spent browsing on the Internet, you do not need a smart phone. For people who use mobile

phones mainly for voice and message exchanges, a generic mobile phone is good enough. But those who are always on the move owing to business trips or work, and need to regularly check their emails, or people who regularly interact on social media sites, a smart phone is the best pick for them.

Smart phones offer various features at your finger tips even when you are on the move. As far as QWERTY keypads and touchscreen technology is concerned, certain models offer you both. Apart from these, smart phones come with features like Bluetooth and Wi-Fi. While Bluetooth helps you transfer data, or provide wireless connection to devices such as printer, the Wi-Fi feature enables you to connect your mobile phone to hotspots for the Internet connectivity. Also, smart phones come with 2 to 5 megapixel cameras.

However, the device has one drawback, i.e., small in-built memory. No smart phone offers you more than 256-512 MB of in-built memory. So, you may have to find alternatives to store all your data or pictures that you have captured on the move. The probable solution to this problem is external memory or flash card. Some smart phones come with 32 GB of expandable memory.

Smart phones also have multimedia features that facilitate song storage. So, all your favourite songs are at your finger tips when you are on the move.

Moreover, with a smart phone you can never lose your way as it comes with Global Positioning System (GPS) that lets you know your current location. All you need to do is ask your vendor to activate the GPS service on your smart phone. Certain smart phones provide free GPS subscription for a month or two.

Smart phone and its operating system

Smart, sleek and trendy mobiles are popular with buyers. These criteria
