

Indian Electronics Industry is poised for growth as we come out of the worst economic meltdown across all industry sectors. Although 2010 is a growth year, and the worst is behind us, the investments and investor-confidence would slowly build up.

—Sapinder Singh, MD, Omega Products

N. Chandramohan, country head (SMT), Juki India, says that STB, DTH, TV, DVD have a high market potential in consumer electronics.

Power booster in demand

All the respondents identified power and infrastructure as level-playing fields in the coming years. It is due to competitive procurement of projects through licencing which has opened up new opportunities for the private sector.

The power sector is growing steadily at 27 per cent for the last couple of years and, with a new market segment evolving for the smart grid segment, the growth is expected to accelerate further. At the same time, the nature of demand is changing continuously, thereby continually redefining the focus area. For an example, Vivek Tyagi, country manager-sales, Freescale Semiconductor, reckons that the power sector is gradually shifting from manual to smart grid and smart meter system, which has MCUs working as the metering brain, in conjunction with the transceiver to communicate data.

With India's electricity grid registering a whopping 27 per cent losses in transmission and distribution, implementation of smart grids and smart

In 2010, we are planning to enter new markets as well as diversification into new product areas. On the basis of market study, our R&D team in consultation with strategy team work on defining technologies that can serve the market. Supply chain network optimisation is an important step to follow. Unfortunately, this is not happening as much as it should.

—Neelam Kumar, Executive Director, Aplab

meters will be necessary to check these losses.

Girish Nangia, partner, Stead Resistor, expects the needs generated by the renewable energy segment would be at peak in 2011, providing an impetus to the slow but steady growth of solar and renewable energy usage. Almost 80 per cent of the respondents expressed similar views.

years is expected to continue in the near future owing to the lower teledensity, which is currently at 30-35 per cent. Moreover, there is a wide gap between rural and urban areas in terms of mobile penetration.

Nationwide deployment of 3G telecom services may also help the country to bridge this huge gap, says Mittal. Further, he adds that the projected growth in the Indian 3G market will largely depend upon the decision of the Indian government to auction 3G frequencies. At present, state-owned BSNL and MTNL are allowed to rollout 3G services in India, while rest of the operators will be issued 3G spectrums through auction. Once this happens, there will be massive investment in 3G deployment and the country will see massive development in telecom infrastructure for the propagation of

Considering Investment opportunities, infrastructure would be a focus area for developing economies, and strategic sectors would see investments from government and private bodies. Instrumentation will be evolved as the 'enabling' partner for all the developments.

—Gautam Awasthi, GM, Marketing, Agilent
