

Lalit Kumar Das, head IDDC coordinator, industrial design, IIT Delhi, speaking at the EFY Summit

- Set up customs-free zones for trading components, machine spares, demo and training centres for faster response
- A separate fund may also be created to provide interest-linked subsidy to promote value-added manufacturing and create products for India
- Government should encourage and provide incentives to the companies targeting the rural market as well as setting up their manufacturing plants in rural market

Research, technology and R&D

- Fostering sustainable ecosystem for innovation and R&D
- Have a long-term vision and support pre-competitive research to have an edge
- Government should focus on areas with higher technology intensity
- Policies should be made more favourable for green technologies like LED lighting, solar, etc, and adoption should be encouraged in households. Incentives should be provided to start-ups
- Creation of a separate R&D fund to incentivise R&D, where the government and the industry are stakeholders

Skilled manpower

- Government needs to focus on skill development. It can help in acquiring skilled manpower for the industry and provide them technical training for manufacturing
- Developing a high-caliber talent pool. Providing higher level trainings to the recruits, focus on building specialisation and language skills
- Develop dedicated re-skilling schools for talent dedicated to the electronics industry
- Assessment programmes to identify skill gaps and encourage more polytechnics and ITIs instead of focusing

N. Chandramohan, country head-SMT, Juki India, speaking at the EFY Summit

on BE and B.Tech alone

Taxation and laws

- The taxation regime of the country needs to be revamped to ensure a favourable business policy and regulatory environment
- Remove all taxation anomalies and bureaucratic hurdles and provide incentives for local manufacturing
- Various laws in India that are inherited from the British are stumbling blocks for any foreign business to set shop in our country. In China, for instance, there are laws to support businesses in the nascent stage. There is therefore a need to re-examine this aspect in the Indian context
- Archaic labour laws, which do not facilitate business, need to be in tune with global best practices
- Institute a fund to support MSMEs in electronics to provide advantage to companies and help them grow

Infrastructure and ecosystem

- Develop industrial parks, hardware parks, SEZs, etc. Industrial parks can address the needs of MSMEs in electronics, where these MSMEs are part of a larger manufacturing ecosystem
- Government should focus on setting up more centres to facilitate testing, calibration and certification.
- Government should encourage SMEs to file IP patents and incentivise the listed Indian patents.
- A plan can be made to develop industrial clusters in cities like Pune, Coimbatore and Chennai, with special focus on the development and production of automotive, textile and telecom electronics equipment. The required ecosystems can be built within such clusters. ●
