

Fig. 3: Error message with code line number

Fig. 4: Output screen when executed without input code

are vital to this program: `execute()` and `err()`. The `execute()` function is used

to execute the command whenever the mouse cursor touches the embed-

ded text. The `err()` function is used to locate any possible error in the command and displays the error messages on the screen.

The program also uses a special popup function created by JavaScript program. That is, it does not have a title bar or any other button on the window screen, but only the display area. Moreover, it strictly runs on IE (Internet Explorer) based machines only.

Steps to compile and run the JavaScript code

Open `jadeclip.htm` in IE browser with JavaScript plug-in enabled.

Bring the mouse pointer on the screen and place the cursor at appropriate location to start coding.

Type the JavaScript code on the editor screen. For example, enter the "`<a href='www.efymag.com'>Electronics For You</a>`" JavaScript code in the editor screen.

Place the mouse cursor on the text labeled 'JavaScript Debugger.' The code gets executed. If there is any problem or error message in the code, you can debug the code.

EFY note. The source code of this project has been included in this month's EFY-CD and is also available on www.efymag.com website.
