

have the scale and ability to sell solar gear cheaply in the Indian market.

Though India's rising power demand and high irradiation levels make it ideal for harnessing solar energy, the country is highly dependent on imports of critical raw materials including silicon wafer used for solar cells and panels.

Solar benefits for India

The winner of this year's *Millennium Technology Prize*, Michael Gratzel, has said that India stands to benefit significantly from his new solar power technology as it is cheap, green and efficient. "I am particularly interested in India. Solar energy is a cheap, abundant resource that is importantly also non-toxic," said the Swiss professor, who won the prize for creating a solar cell that mimics the manner in which plants produce their own food with photosynthesis.

"Solar cooling will immensely help India as refrigeration is directly related to health issues," Gratzel claimed, after receiving the prize. Solar cooling is a technique that utilises energy from the sun to generate power for refrigeration.

"In India, petrol is expensive. Solar energy is the best alternative as there is a lot of sunshine in this country," the professor said as he displayed the dye-sensitised solar cell that fetched him the award. Gratzel, who is the director of the laboratory of photonics at the Ecole Polytechnique Federale de Lausanne, said, "Solar cells can also provide energy for water purification. Solar panel is now already capable of charging your mobile phone."

Telecom proposal modeled on CMC

The Indian government has come out with a proposal to set up a company that will get all telcos and gear makers to operate within a set-up that will address security concerns arising out of foreign, especially Chinese, telecom equipment companies building and managing telecom networks in the country. If this proposal is cleared, the
