Q. What does the Energy Star rating mean for fluorescent tubelights? What makes the appliances having this symbol more efficient than others?

Subhasis Shau
Rourkela, Orissa

A. Energy Star is an international standard for energy-efficient consumer products, developed as part of a programme in 1992 by the Environmental Protection Agency (EPA) of USA. The objective of the programme was to formulate the strategy for identification and promotion of energy-efficient products.

Products carrying Energy Star symbol provide a way for businesses and consumers to save money, while at the same time protect the environment. Since its onset, the scope has expanded to include not only major appliances but also new homes and buildings. A major appliance that sports the Energy Star label is not necessarily a better product than a comparable model, but in order to be rated Energy Star, it must meet very strict energy-efficiency guidelines as set out by that programme.

Typically, appliances carrying the Energy Star rating are 10 to 20 per cent more energy-efficient than non-rated models. Of course, one has to pay more for the product as Energy Star rated products are costlier than comparable models.

When purchasing any appliance, consumers should look for the Energy Star rating and energy guide. An appliance labeled 'Energy Efficient' may be low energy rated, but may not meet the standards to be an Energy Star product. Energy guide ratings for appliances show their

typical usage in kWh per year. The lower the energy number, the more cost-efficient the appliance is to run.

There is another rating that consumers should pay attention to: The CEE tier I, II or III rating shown on major home appliances. This rating means that the appliance is even more efficient. While the CEE rating does not replace an Energy Star rating, it complements it and denotes an appliance that is super-efficient. Here is what the energy star ratings for different products:

Home electronics: Energy Star qualified televisions use 30 per cent less energy than average.

Lighting: Energy Star is awarded to only certain bulbs that meet strict efficiency, quality and lifetime criteria.

Energy Star qualified fluorescent lights uses 75 per cent less energy and last up to ten times longer than normal incandescent lights.

Energy Star qualified light-emitting diode (LED) lights use at least 75 per cent less energy than incandescent lighting, saving on operating expenses. These also reduce maintenance costs.

In India, the programme is run under Bureau of Energy Efficiency under the Ministry of Power. Currently, equipment and appliances covered are frost-free refrigerators, tubular fluorescent lamps, air-conditioners, distribution transformers, induction motors, pump sets, ceiling fans, electric geysers and colour TVs.
