

first LED-based projector. Utilising 3LCD technology, the F10M provides customers with a bright and energy-efficient projector, and when paired with an LED light source, even more amazing colour and image quality.

According to Samsung, the F10M delivers 1000 lumens with a light life of more than 30,000 hours. Thus it can be used four hours per day for virtually 20 years without any need for replacement. It also offers XGA resolution, with HDMI input and PC connectivity. In addition, the LED-based projector is said to offer instant on/off functionality, requiring almost no warm-up time, producing a nearly instantaneous projected image.

The projector has a USB port and a file viewer for displaying Microsoft Office or PDF files without a PC connection.

World's fastest laptop hard drive

Seagate has started shipping the world's fastest 6.4cm (2.5-inch) laptop PC hard drive, combining SSD-like performance with the massive capacity and much lower cost of HDDs. The Momentus XT drive features Adaptive Memory—a groundbreaking new technology from Seagate that learns and optimises the drive's performance to each user by moving frequently used information into the flash memory

Seagate Momentus XT drive

for faster access. It boots up to 100 per cent faster than traditional 5400-rpm drives—the mainstream spin speed for laptop PCs—and sets new benchmarks for real-world system performance for laptops and gaming systems.

The unique Adaptive Memory technology works by identifying patterns in how often certain digital data is used, and then moving the most frequently used information to the embedded solid-state memory for faster access, effectively tailoring hard drive performance to users and their applications.

Server that performs like a supercomputer

SeaMicro, a US-based startup, has developed a server with 512 Intel Atom

chips that performs like a supercomputer but consumes 75 per cent less power and space than current servers.

This development could be a big blow to server vendors such as Dell, Hewlett-Packard and IBM. And it could be very useful for big data centres that are consuming too much power and are having a hard time keeping up with the demand for free Internet services.

The big server chips made by companies such as Intel, Advanced Micro Devices and IBM focus too much on performance and aren't power-efficient enough. These are like using the space shuttle to drive to the grocery store.

So Andrew Feldman, chief executive of SeaMicro, guessed that servers could benefit by using lots of smaller processors instead, and it got lucky with Intel's low-power, low-cost Atom chip for netbooks. That lowered power consumption, since Atom processors deliver three times the performance per watt versus Intel's server chips.

SeaMicro also lowered the power consumption in the rest of the system, which accounts for about two-third of the power consumed by a server, with a trick known as virtualisation.

Glasses-free 3-D

Researchers at Microsoft's Applied Sciences Group have developed a new type of lens that could help make

Attention Reseller & Dealers, partner with the
