

a faster and more intuitive way to input text on touchscreens—at over 50 words per minute.

Swype's software detects where a finger pauses and changes direction as it traces out the pattern of a word. The movements do not have to be precise because the software calculates which words a user is most likely trying to spell. The application works across a variety of devices such as phones, tablets, game consoles, kiosks, televisions, virtual screens and more.

USB typewriter

The USBTypewriter is a new and groundbreaking innovation in the field of obsolescence. Lovers of the look, feel and quality of old fashioned manual typewriters can now use them as keyboards for any USB-capable computer, such as a PC, Mac or even iPad!

The modification is easy to install, it involves no messy wiring, and does not change the outward appearance of the typewriter (except for the USB adaptor itself, which is mounted in the rear of the machine). So the end result is a retro-style USB keyboard that not only looks great, but feels great to use.

Simply connect your device to the USBTypewriter, which holds the device in its carriage whilst simultaneously inputting typed letters. All it needs is a Bluetooth component to replace the cable, and a writing application that can use the accelerometer to detect a carriage return and move you to a new line.

Inside, there is a sensor strip under the keyboard that detects the key-presses that hit it, and this pulse of electricity is then passed on to an Arduino circuit board, whereupon it is translated into a standard USB key-down event. All you need to do is plug it in and type.

iPhone 4G

Apple is set to create a sensation in the mobile phone market with launch of iPhone 4G. This next-generation smart

Apple iPhone 4

phone uses the advanced LG LCD Display technology, namely, In-Plane Switching (IPS).

Apple has added a host of new features to the iPhone 4G to give an all-round better experience to its customers. The new model of the mobile phone with an upgraded operating system comes in a 9.3mm body, with glass on both sides and a steel band that surrounds the unit and works as an antenna. In addition, the phone has a built-in 5MP camera with flash and a battery life that is 40 per cent longer. A never-before-seen feature is the high-definition display called Retina, which has a resolution four times that of iPhone 3G.

Apple claims its iPhone 4G to be the thinnest smartphone in the world. Better screen resolution, longer battery life, WiFi and a camera with high resolution make this handset something to watch out for!

Mobile expense tracker

Worried about your uncontrolled expenses? Here is a solution for you. PaisaGate in India has come up with an expense tracking utility service that

helps its users save more of their income by letting them take control of their expenses. The service lets users perform basic money management tasks such as setting budgets and tracking everyday expenses by simply using their mobile phone. It sends out daily summary reports by SMS that provide information about the user's total expenses till date and also the balance amount left in the user's spending budget.

This two-way interactive service using SMS can be accessed by a large number of basic mobile phone users in India. PaisaGate also provides mobile expense tracker software for Java-enabled phones and supports iPhone via customised iPhone Web application.

Users can register for the service by sending SMS 'PAISA' to 09600024000 or by visiting online at 'www.paisagate.com.'

Indian Census 2011 goes hi-tech

Indian Census 2011, the world's largest data collection exercise, has deployed advanced mapping technology to reduce the errors of omission and duplication. In urban area, it is using three-dimensional geographical information system (GIS) maps to earmark blocks, making it easy for enumerators to cover all the units in their domain. In rural areas, on the other hand, two-dimensional maps will help supervisors mark out the territory to be covered by enumerators. Thus the data can now be spatially referenced.

GIS combines hardware and software for storage, mapping and analysis of data. By using the computerised GIS system, the Census Commissioner's Office is ensuring that geographic data is accurately mapped and used by researchers to make connections and deeper analyses. The maps have been acquired from the Survey of India at Dehradun and local governments.
