COUNTRY MANAGER FOR SANDISK INDIA AND SAARC

“ CONSUMER TREND IS TOWARDS HAVING MULTIPLE CARDS”

What's the difference between a flash memory chip and flash memory card? What's the advantage of a memory card over raw flash chip?

It's like the difference between having a nice silk cloth and an outfit. With silk cloth, which is raw, you can't do anything. Raw flash doesn't know how to save memory, how to delete it and how to maximise it. It needs a controller, or you can say it needs a brain. This is just like a human being; if your brain is dead, what would you do with your body. So raw chip needs a controller to make it a USB, SSD or memory card.

What's advisable: using multiple small cards or a single big card?

Consumer trend is definitely towards multiple cards. All the camera memory cards of SanDisk have a blank strip, in which you can write the content of that particular card. So

Founded in 1988 and headquartered in California, USA, SanDisk is a global leader in memory cards. SanDisk invented flash storage cards and pioneered the USB flash drive, and developed or co-developed the CompactFlash, SD (including microSD) and Memory Stick PRO card formats.

Manisha Sood, country manager for SanDisk India and SAARC, is responsible for establishing the sales and marketing infrastructure within India and also overseeing the sales of memory cards, USB, MP3, gaming and mobile products. In a conversation with Uma Bansal, deputy editor at EFY, Ms Sood answered some common consumer queries about memory cards. Excerpts

if you have been on a vacation to Thailand, you can write Thailand vacation on the card. Consumers are keeping the cards the way they earlier kept CDs and not exactly downloading everything on the PC.

Coming to buying a memory card, how does one's device affect the choice of a memory card?

The chip should be from a reputed brand. Also, buy from

a proper shop with a bill supported by warranty. If you are buying the card for a digital camera, look at the kind of the camera. For example, for latest cameras, which are 10 megapixels (MP) or above, buy a high-speed memory card like Ultra and Extreme in SanDisk series because shutter speed of these cameras and file size created by clicking picture on a 10MP camera are much larger. So if you click in quick succession (bulk mode) to capture swimming/gliding in action, and your camera doesn't have a high-speed memory card, the camera may miss out on certain shots as speed of the camera and speed of the card should match. Also, when shooting HD video with a point-and-shoot camera, you definitely require a high-speed card.

So the main things to look for are brand, warranty, authorised store of the brand, and right speed and right specifications for the device that the consumer is using (phone, camera, handycam, etc).
