INVENTING NEW TECHNIQUES OF PRODUCING LIGHT

Please brief on the choice of a memory card for a cellphone and camera.

I have already explained the criteria for cameras. When buying for a cellphone, first figure out what you want to do with the phone. Do you want to store more songs, pictures or videos? What kind of cellphone are you carrying? What's the MP of the camera of the phone? Depending on the usage, select the capacity. Normally, the dealer has a capacity chart. So you can see how much data a certain capacity will store.

Is it always advisable to go for a high-speed rating card?

If the device is new—currently, all digital cameras are 10/12 MP and above—definitely, a high-speed card is desired. By high-speed, I mean 16 MB/s.

What precautions to take when using a memory card in a different device?

Using a memory card of a cellphone in some other cellphone will not be an issue. Using the memory card of a phone for a digital camera is, however, not advised, as the two have different speeds. Normally, for a cellphone, you don't need a high-speed card as they are not up to that level and speeds are not that much. Cameras are much more advanced in terms of speed. The most commonly used card for a cellphone is microSD normally. SD cards are used in digital cameras.

How important is the formatting of a memory card? When and how often should it be done?

When you buy a memory card, format it first to get the maximum amount of storage and eliminate any bad sectors.

Can one recover accidentally deleted data from a memory card? If yes, how?

For our Extreme cards, you can go online and download a software called RescuePro that lets you recover some of your deleted files.

How can one protect the memory card from unauthorised access to data stored on it?

Lock mechanism is only for write. It's just a mechanical lock—a switch—and anybody can use it. So the main thing is to keep your card safely.

Any tips for avoiding memory card problems?

Memory cards are not very expensive and are available within the range of Rs 500. But, that doesn't mean you can buy them from any shop. It's important to buy a branded product as you are going to store your important data on it. Also, you need to keep the card safely. If the card will be used in a very low or very high temperature, go for a high-end memory card that will last in these conditions. SanDisk's Extreme cards can withstand temperatures of -20°C to +85°C. ●
