

SIMPLE CAD UTILITY PROGRAM USING VISUAL BASIC

■ HIMANSHU SHARMA

Here is a computer-aided design (CAD) utility program that lets you design simple two-dimensional models, shapes,

draw shapes like lines, rectangles, circles, poly-lines, text and dimensions; change entity attributes via module window; and configure drawing environments.

The program is developed using

tons to design the objects. Just enter in this software the required parameters of the object to be drawn and click the mouse. The object is created right in front of you on the screen.

The software can be used for:

1. Auto-plotting of figures by adding data
2. Creating ruler functions in VB program
3. Displaying X and Y coordinates of mouse cursor movement

Other applications can be added with slight modification in the code.

Let's explore the application of this software by creating a digital event counter panel.

Typically, the front panel of an event counter includes the following modules:

1. LCD panel for displaying data to the user
2. Main on/off button
3. Reset switch; used when the system hangs
4. Two connecting points for the probes
5. LCD backlight on/off button

Visual Basic 6 in object linking and embedding (OLE) environment. The main program output is shown in Fig. 1.

You don't need to use mouse but-
