Fig. 8: Final counter panel with LCD

Working of the program

Double-click the executable file (simplecad.exe). A window appears as shown in Fig. 1.

Start designing the digital counter panel by entering the name of the project as 'Counter' in the edit box as shown in Fig. 2. In this main window, you can see line bars with red and blue scaling marks. These are the rulers. In the bottom left-hand corner of the screen, you can see blue (+) and red (-) buttons, which are used for enabling or disabling the rulers. Note that all dimensions are in inches (one inch equals 2.54 cms).

When you move the cursor on

the form with your mouse, there is a line on the ruler that keeps on moving as your mouse cursor moves and there are two textboxes showing positions of your mouse cursor (see Fig. 3).

Enter panel size of 45.72×20.32cm² (18×8-inch²) as shown in Fig. 4 and press 'Draw' button. Now your counter panel size on the screen looks as shown in Fig. 5.

First, place a 15.24×5.08cm² (6×2-inch²) LCD on the screen, leaving 5.08 cm (2 inches) from top Y position and 15.24cm (6 inches) from left X position. For this, click 'Module' option. A module window appears as shown in Fig. 6. Enter in the edit window the following parameter values for the module to be placed on the screen:

Width: 22.86 cm (9 inches)

Height: 5.08 cm (2 inches)

X Position: 10.16 cm (4 inches)

Y Position: 2.54 cm (1 inch)

Press 'Add' button to store the entered parameters as shown in Fig. 7.

Now press 'Draw' button. The final event counter front panel will look as shown in Fig. 8.

If the rectangular red border line of your panel disappears, just press 'Draw' button to make it reappear. Press 'Save' button to save the work.

EFY note. The source code of this project has been included in this month's EFY-CD and is also available on the www.efymag.com website.

JAVASCRIPT-BASED INDIC SCRIPT GENERATOR

■ BUKYA SRIDHAR

English is the language of web-pages, for mailing, browsing, etc. However, with an increase in the number of people thronging the Web community, many of whom do not understand English, there arises a

need to cater to local languages too in a country like India.

Windows XP has inbuilt support for nine Indian local languages, which can be activated using a setup CD. But all those who do not have a setup CD remain helpless, as the Indic language setup cannot be done without it.

Presented here is a JavaScript-based program that can be used to type all the nine Indian local languages, viz, Bengali, Hindi, Gujarati, Kannada, Malayalam, Oriya, Punjabi, Tamil and Telugu. This program is useful for all the computer enthusiasts who wish to create documents/
