

NI LabVIEW for Control and Mechatronics

One Platform from Concept to Implementation

Researchers and educators are discovering the advantages of using a single platform for designing, simulating, prototyping, and deploying control systems. With the LabVIEW graphical development platform, you can implement advanced control algorithms with the flexibility of combining graphical and textual programming. And through tight integration between National Instruments and third-party hardware, it's easy to deploy algorithms in real time using virtually any microprocessor or FPGA platform such as NI CompactRIO. With NI control design tools, students and researchers at Virginia Tech were able to use LabVIEW to create DARwin, a fully autonomous humanoid soccer-playing robot.
