

Desi Android to take on Apple iPad

Everyone has been raving about Apple's tablet PC iPad—a complete entertainment package. Add an extra power, better display and video/graphic performance, you'll get Adam. This Android-based tablet PC, developed by Hyderabad-based Notion Ink, promises to give Apple a run for its money in the tablet PC market

■ VANISHA JOSEPH

Tablet PCs are the new buzz in the market. Be it for watching TV, reading a book or playing video games, the tablet PCs available in the market help you do it all.

Let's elevate the experience further. Imagine a tablet PC with a screen that works like a normal screen indoors and adjusts itself into a paper display when outside, reducing the strain on your eyes. Or a tablet PC that runs at a stretch for eight hours, letting you watch a crucial one-day cricket match despite the electricity outage. It would sure be a dream-come-true gadget. Hyderabad-based Notion Ink, powered by the brains of six IITians and one MBA graduate, has made this dream a reality with its Android-based tablet PC, Adam.

Be it the ambidextrous Pixel Qi screen or the nVidia Tegra 2 chipset giving the device a fast speed, Adam is revolutionary in every sense. The Tegra 2 chipset incorporates nine independent processors to handle Web browsing, HD video encoding/decoding as well as mobile gaming. It accomplishes intensive graphic/video activity with very low power consumption. The 25.7cm (10.1-inch) Pixel Qi screen has a resolution of 1024×600 and supports 1080p full high-definition (HD) video playback and low-power text display, making Adam an apt gadget for video or graphics-intensive work.

“Adam is a revolutionary product integrating the best possible technologies today. It is based on Android, Google's operating system, which by the dint of being open source opens a lot of possibilities for developers around the world to create the

best applications. In short, Adam combines the power of a netbook, e-book reader and smart phone. It is sure to redefine the concept of mobility and usability,” says Rohan Shravan, director and CEO, Notion Ink Design Labs.

Further, Adam sports a 180-degree swivel camera.

Cool technology

Having filed a couple of patents including one patent on the unique swivel camera and back trackpad, Adam sports cool technologies.

Soothing to the eye. The Pixel Qi display powering Adam has a faster refresh rate and uses fully saturated colours. It provides two modes, one emits light and the other requires ambient light.

“We use sensors to control the lighting mechanism, which gives a feel of constant brightness, without which users will have to keep on switching between the different modes, and manually control the brightness. This feature makes it a good reading tool for indoors and outdoors. Now, you can sit back and enjoy,” says Shravan. iPad, on the other hand, doesn't have any hardware switch to adjust brightness of the screen for ambient light conditions.

The Pixel Qi display is also very power-efficient, with half to one-fourth the power consumption of LCD screens used by competing products like iPad.

Long battery life. Adam allows 48 hours of standby, eight hours of 1080p HD video playback and 16 hours of Wi-Fi Internet surfing. The nVidia Tegra system-on-chip processors enable Adam to have days of battery back-
