

# Your One-stop Resource

For microprocessor simulation, 3D modeling, animation, computing, text editing and file sharing software

## What's EFY CD all about?

Welcome friends! Wondering what goodies we have in the EFY CD? Allow us to reveal all! There are three to four different categories of software that we feature every month, most important of which is the 'Design and Simulation' category. It comprises various electronics software, datasheets, e-books, circuit ideas and EFY software. The CD also contains three other sections: Resources, Fun and Utility. 'Resources' contains essential software like Acrobat Reader, Enzip and a few others, which form the basic requirements of any PC. The 'Fun' segment includes computer games, whereas in 'Utilities' you will find multimedia and IDE software, Internet applications, etc.

## Graphical Network Simulator

(Networking, 11.4 MB)

This open source software for network simulation functions under the GNU GPL licence. Its latest version was released on November 28, 2009 and written using Python language. The software runs on Windows, Linux and MAC OS X. It is a great simulator for both experts as well as beginners, as it gives complementary tools for the real Cisco labs network engineers, administrators and people wanting to pass certifications such as CCNA, CCNP, CCIP or CCIE.

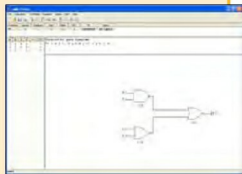

It also gives you the freedom to connect the simulated network to the real world. Moreover, it comes with dynanips (a core program that allows Cisco IOS emulation), dynagen (a text-based front end for dynanips) and Pemu (a Cisco PIX firewall emulator based on Qemu).

## Logic Friday (Digital Logic Circuit Simulator, 0.8 MB)

Logic Friday is an open source software for Boolean logic optimisation, analysis and synthesis. It is useful for all—students, hobbyists and engineers. The software has two programs, espresso and misl, for minimisation and gate diagram synthesis, respectively. It allows designers to work with 16 inputs and 16 outputs and enter logic functions as truth table, an equation or a gate diagram. It also gives the option to automatically generate a multi-level gate diagram using gates chosen from the library, compare logic function and generate new functions as logical combination of others. Further, using it you can export and import truth tables as CSV files for editing in spreadsheet applications.

The minimum system requirement for the software is Microsoft Windows 98 through Windows XP, Microsoft Windows Explorer version 5 or above and 450MHz Pentium-class PC with 128MB RAM and 10MB hard disk space.

## MacAnova (Computing, 8.54 MB)

MacAnova is a free and open source software for statistical analysis. It runs on Windows, Linux and Mac. The current version of the software is 5.05 release 1 and it is written by Gary W. Oehlert and Christopher Bingham. The software has various capabilities like analysis of variance and related models, matrix algebra, time series analysis, and uni- and multi-variate exploratory statistics. Being open source, it supports multiple platforms and gets contribution from the open source community and many others. But when it comes to the Windows platform, the graphical interface is not user-friendly, as most of things are still on the command line.
