

JAVASCRIPT-BASED SEARCH ENGINE IN HTML

■ BUKYA SRIDHAR

Indian railways today offers facilities like online reservations and online transactions (e-ticketing). For getting the reservation done or enquiring online, you have to depend on a search engine. Search engines pop up the results that are important to you.

For the convenience of the passengers, Indian railways has introduced a server-based client module that gives PNR status or information about the seat availability. It runs on DOS. Some passengers may even want time-table for their zone or more specific information matching their need. Given here is a simple JavaScript-based code that searches a database to give the required information at the click of a button.

The program

The program has two parts: man-machine interface and database. The man-machine interface (refer Screenshot 1) can be loaded on the client machine. The database (refer Screenshot 2) can be loaded on the server and the path may be provided in the client machine, which is at the terminal, where the user can download the information on the screen.

The JavaScript program has two files: HTML file for the interface and XML file for the database. You can place both the files in the same or separate directories, and assign a correct path in the HTML file for the database file. XML, short for 'eXtensible Markup Language,' is a special program to create databases of liter-
