TOOLS & EQUIPMENT

Handheld labeller

Brady, a provider of identification solutions, has introduced the BMP21 portable label printer. Simple to operate and quick to print, it is an economical, versatile labeling tool for voice/data communication, electrical and general industrial identification needs.

Labels created using the printer stay stuck and legible for years.

Solder dross separator

With every operation of the wave soldering machine, dross gets generated. The solder dross separator from Ren Thang, Taiwan, helps users to extract

pure tin from the dross, thus saving substantial amount of money in daily production

activity through recycling process. Depending on the quality of solder used, tin extraction can be as high as 80 per cent.

This machine is useful for extracting tin from both leaded and unleaded solder dross, irrespective of whether the dross is hot or cold.

Machine operation is very simple and involves loading of dross in the pot of the machine, setting appropriate temperature using in-built temperature controller and rotating the handle for 15 to 20 minutes. After this, pure tin starts flowing out of the outlet.

VLSI development platform

Technido has introduced a front-end VLSI development platform that supports implementation of digital system designs as per the syl-

labus of technical universities using VHDL/VERILOG languages on a FPGA device. Moreover, it supports a digital system or an interface with an external analogue circuit designed by the user for any type of embedded application.

The platform operates off +5V power supply and includes an FPGA (XC3S400PQ208), 136 inputs/outputs, on-board flash PROM and two global clocks. It also features on-board six 7-segment displays, 8-pole DIP switch, eight LEDs for testing and debugging, four pushbutton switches, serial connector for UART communication, USB connector for UART communication, VGA connector, PS2 interface, three 40-pin expansion slots and numerous

sample codes.

Heavy-duty soldering station

Sumitron Exports has introduced a digital high-power soldering station for soldering large to fine components.

The Hakko FX-838 allows soldering at lower set temperatures, thus reducing the risk of damage to heat-sensitive chips and work pieces. This also helps in reducing the oxidation of the soldering tips. It operates at a maximum temperature of 5000°C, which helps in soldering power supply boards easily because the high-power 150W hand piece can provide great thermal recovery.

TEST & MEASUREMENT

Automated test support for SAS conformance

Tektronix, Inc. has introduced an automated compliance and test automation solution that spans both SATA and SAS (serial attached SCSI). It encompasses the breadth of SAS conformance tests defined by UNH-IOL and the
