

Moore's Law beyond the end of the international technology roadmap for semiconductors, circa 2020, according to HP.

Mobile chip to detect toxics in the air

Researchers at the US Homeland Security's Science and Technology Directorate have designed a chip that, on being embedded into a mobile phone, could aid in detecting deadly chemicals present in the air. Dubbed 'Cell-All,' this chip costs less than a dollar, and is programmed to alert the mobile carrier and central station as and when the presence of toxic chemicals is detected in the air.

An increased number of such alerts would mean the presence of harmful chemicals and might indicate the need for evacuation.

Motherboard with iPad recharging capability

Gigabyte Technology has announced a full range of Intel chipset-based X58, P55, H55, H57 as well as current and upcoming AMD 800 chipset series motherboards that allow charging of Apple's latest hot-selling iPad while the device is in use (on) and also when not in use (off).

Recent industry reports indicate that USB ports on most Windows PCs are unable to provide enough power to

charge the new iPad while the device is in operation, due to differences between the motherboard's USB power output and the charging specifications of the device.

However, Gigabyte's unique USB power design is able to deliver extra power for devices that require more than the 500 mA delivered from a traditional USB port. With a simple on/off chargedriver update that can be found on the Gigabyte website, Gigabyte motherboard users are able to take full advantage of USB charging of their iPad.

Highest-bandwidth FPGAs

Altera Corp. claims to have announced the industry's highest-bandwidth FPGA family—the next-generation 28nm Stratix V. Offering up to 1.6 Tbps of serial switching capability, Stratix V FPGAs leverage a myriad of new technologies and a leading-edge 28nm process to reduce the cost and power of high-bandwidth applications.

The FPGAs provide up to 1.1 million logic elements, 53MB embedded memory, 3680 18x18 multipliers and integrated transceivers operating up to an industry-leading 28 Gbps.

These also claim to incorporate the industry's highest level of application-targeted hard intellectual property (IP) for increased system integration and performance without the cost and power penalty.

The family includes four variants that address a broad range of applications in the wireless/wireline communications, military, broadcast, computer and storage, test and medical markets.

Get SMS on your watch

Japanese watchmaker Citizen has designed a new wristwatch that can receive text messages from the mobile phone. Called iVIRT M, it uses Bluetooth to synchronise with mobile phones and get text messages. When the user gets a text message on his mobile, the watch glows and vibrates.

Citizen iVIRT M watch

It can read the subject line of the message and up to 70 characters of text. For easier reading of messages, the watch magnifies letters 1.2 times their original size.

"These watches are good for checking important messages in a casual way, even in conferences or on crowded trains, where users may feel uneasy taking out their mobile phones," according to a Citizen spokesman.

Book your bus tickets online

Bus travellers all over India can now heave a sigh of relief as they won't have to stand in queues or jostle through the crowd onboard for buying a ticket. Now, they can instead book their tickets online, and even select their desired seat via Bussafar.com.

With a list of over 2000 buses, 100 bus operators and 1000 routes spreading across 14 states in the country, the portal allows you to find inter-city and inter-state bus services without any hassle.
